# VERMONT VITAL STATISTICS ANNUAL REPORT 2020

---

State of Vermont  
Phil Scott, Governor

Agency of Human Services  
Mike Smith, Secretary

Department of Health  
Mark Levine, MD, Commissioner

July 2022

*We gratefully acknowledge the contributions of the medical records staff, physicians and midwives, funeral directors, lawyers, and court clerks for their help in collecting and providing us with this data.*

*We also recognize the 251 town and city clerks, who are our local registrars. Without them, these analyses of Vermont's vital statistics would not be possible.*

# Introduction

Figure 1 – Vermont County Map

# THE VERMONT VITAL STATISTICS SYSTEM

Statewide vital registration began in Vermont in 1857, when the General Assembly passed a bill requiring that towns report to the Secretary of State all births, marriages, and deaths occurring in their jurisdiction. Prior to that time, some towns kept such records in order to resolve questions concerning the distribution and inheritance of property. Vital records, particularly death records, gradually became recognized as an important tool in studying the location and spread of epidemics. In 1896, the Legislature transferred responsibility for the vital statistics system to the newly formed Board of Health, the forerunner of the Vermont Department of Health. The Department of Health has retained this responsibility to the present day.

The Vermont vital statistics system monitors the following vital events: births, deaths, marriages, divorces and dissolutions, fetal deaths, and abortions. Each type of vital record follows a different path before being used to produce the statistics published here.

**Births:** When a birth occurs in Vermont, the physician, midwife, or other birth attendant are required to file with the State Registrar within five business days a report of birth. For hospital births the medical records staff enter the birth information into the Department of Health's Electronic Birth Registration System (EBRS). Once a birth record is submitted in the EBRS, it is registered in the Statewide Registration System and a copy of the birth certificate can be issued upon application by an eligible party.

**Deaths:** The licensed healthcare professional who last attended a deceased person is responsible for completing the medical portion of a report of death via the Department of Health's Electronic Death Registration System (EDRS) within 24 hours after a death and the nonmedical portion is completed in the EDRS by a funeral director or the person in charge of the body. Once a death record is completed in the EDRS, it is registered in the Statewide Registration System and a copy of the death certificate can be issued upon application by an eligible party.

**Marriages:** When a couple wishes to marry in Vermont, they provide a town clerk with the information needed to complete the license. The couple takes the license to an officiant, who signs and dates it, and returns it to the town clerk. The town clerk records and files the certificate and sends a certified copy to the Department of Health.

**Divorces and dissolutions:** A divorce certificate or certificate dissolving a civil union is initiated by a lawyer or other individual handling the divorce or dissolution. The certificate is filed with the court as part of the divorce or dissolution proceedings. The court keeps the certificate until the decree becomes final, usually three months after the court hearing. When the decree is final, the court clerk signs the certificate and sends it to the Department of Health for filing.

**Fetal deaths and abortions:** Reports of fetal death and induced termination of pregnancy (abortion) are sent directly to the Department of Health by the physician, hospital, or clinic that performs the procedure. By law, these reports are for statistical purposes only, are not public records, and are destroyed after five years.

The Department of Health also receives abstracts for Vermont resident births and deaths that occur in other states and in Canada. This allows the Department to do statistical analyses of vital events involving Vermont residents, including those which occurred outside of the state. All vital records received are stored electronically, and data from births and deaths which occur in Vermont is transmitted to the National Center for Health Statistics to become part of a national database.

## EXPLANATORY NOTES

1. The tables in this bulletin were derived from records of vital events filed at the Vermont Department of Health for calendar year 2020.
2. Rates are based on the 2019 population estimates produced by the United State Census Bureau.
3. Caution must be used in comparing rates due to the small population in Vermont and the small number of events recorded.
4. In past reports rate comparisons were made to the U.S. white population rather than entire U.S. population because less than five percent of the Vermont population was non-white. However, starting with the 2011 report, comparisons are made to the total U.S. population.
5. If you have questions about the information found in this bulletin, you may contact a statistician at the Vermont Department of Health, 802-863-7300.
6. If you have questions about the population figures found in this bulletin, you may call the Vermont Department of Health to request a copy of The Population and Housing Estimates, which also provides information about age groups other than those presented in this publication.
7. The following is a list of Vermont's counties and the county abbreviations that are used in this bulletin.

Addison	ADD	Lamoille	LAM
Bennington	BEN	Orange	ORG
Caledonia	CAL	Orleans	ORL
Chittenden	CHI	Rutland	RUT
Essex	ESX	Washington	WAS
Franklin	FRA	Windham	WHM
Grand Isle	GI	Windsor	WSR

## DEFINITIONS, RATES, AND RATIOS

**ABORTION:** The purposeful interruption of an intrauterine pregnancy with the intention other than to produce a live-born infant or other than to remove a dead fetus, and which does not result in a live birth.

**ABORTION RATE:** Number of resident abortions occurring in Vermont x 1000, divided by the total resident women ages 15 to 44.

**ABORTION RATIO:** Number of resident abortions occurring in Vermont x 1000, divided by the total resident live births.

**AGE ADJUSTMENT:** Age adjusting allows one to compare rates among populations having different age distributions by adjusting the crude rates in each population to a standard population base. In this bulletin, county rates are adjusted using the state population distribution as the standard.

The computation formula is: The sum of (age-specific rate for each age group x standard population in that age group) multiplied by 1000, and then divided by the total standard population.

**AGE-SPECIFIC DEATH RATE:** Number of resident deaths in a specific age group x 1000, divided by the total resident population in a specific age group (using population estimates as of July 1).

**AGE-SPECIFIC FERTILITY RATE:** Number of resident live births to mothers in a specific age group x 1000, divided by the total resident female population in a specific age group (using population estimates as of July 1).

**AGE-SPECIFIC PREGNANCY RATE:** Number of resident pregnancies to women in a specific age group x 1000, divided by the total resident female population in a specific age group (using population estimates as of July 1).

**ANNULMENT:** The invalidation or voiding of a marriage, or civil union, which confers on the parties the status of never having been married to each other.

**CIVIL UNION:** A civil union is a legal relationship that provides for same-sex couples in Vermont all the benefits, protections, and responsibilities under law as are granted to spouses in a marriage.

**CIVIL UNION RATE:** Total number of civil unions x 1000, divided by the total resident population (using population estimates as of July 1).

**CRUDE BIRTH RATE:** Number of resident live births x 1000, divided by the total resident population (using population estimates as of July 1).

**CRUDE DEATH RATE:** Number of resident deaths x 1000, divided by the total resident population (using population estimates as of July 1).

**CUMULATIVE ROW PERCENT:** The total number of cases in the current column plus each previous column in each row, expressed as a percentage of all cases in that row.

**DEATH:** The permanent disappearance of any evidence of life at any time after live birth.

**DIVORCE:** The final legal dissolution of a marriage.

**DIVORCE RATE:** The sum of the number of divorces and annulments x 1000; divided by the total resident population, (using population estimates as of July 1).

**DISSOLUTION:** The final legal dissolution of a civil union.

**FERTILITY RATE:** Number of resident live births to women ages 15 to 44 x 1000, divided by the total resident female population ages 15 to 44 (using population estimates as of July 1).

**FETAL DEATH:** A reportable fetal death is a death prior to the complete expulsion or extraction from the mother of a product of conception, which has passed through at least the 20th week of gestation or weighs more than 400 grams; the death is indicated by the fact that, after such expulsion or extraction, the fetus does not breathe or show any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles. Heartbeats are to be distinguished from transient cardiac contractions; respirations are to be distinguished from fleeting respiratory efforts or gasps.

**FETAL DEATH RATE:** Number of resident fetal deaths x 1000, divided by the total resident live births and resident fetal deaths.

**FETAL DEATH RATIO:** Number of resident fetal deaths divided by total resident live births.

**INFANT DEATH:** Death occurring in the first year of life.

**INFANT DEATH RATE:** Number of resident infant deaths x 1000, divided by the total resident live births.

**LIVE BIRTH:** The complete expulsion or extraction from the mother of a product of conception, irrespective of the duration of pregnancy, which, after such expulsion or extraction, breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of the voluntary muscles whether or not the umbilical cord has been cut or the placenta is attached. Heartbeats are to be distinguished from transient cardiac contractions; respirations are to be distinguished from fleeting respiratory efforts or gasps.

**LOW BIRTH WEIGHT:** A baby weighing less than 2,500 grams (5 pounds, 8 ounces) at birth.

**LOW BIRTH WEIGHT PERCENT:** The number of live births weighing less than 2,500 grams divided by the total number of live births.

**MARRIAGE:** The legal union of persons of opposite sex.

**MARRIAGE RATE:** Number of marriages x 1000, divided by the total resident population (using population estimates as of July 1).

**NATURAL INCREASE:** Occurs when the number of births is greater than the number of deaths.

**NEONATAL DEATH:** Death of a live-born infant before the infant becomes 28 days old (up to and including 27 days, 23 hours, 59 minutes from the moment of birth).

**NEONATAL DEATH RATE:** Number of resident neonatal deaths x 1000, divided by the total resident live births.

**OCCURRENCE:** The place where the event actually occurred.

**PERINATAL DEATH:** A fetal death or a death occurring before the infant becomes seven days old (up to and including six days, 23 hours, 59 minutes from the moment of birth).

PERINATAL DEATH RATE: Number of resident perinatal deaths x 1000, divided by the total resident live births and resident fetal deaths.

PLURALITY: The number of siblings born as a result of this pregnancy.

PREGNANCY RATE: Number of resident pregnancies in women ages 15 to 44 x 1000, divided by the total resident female population ages 15 to 44.

RESIDENCE: The usual place of residence for the person to whom the event occurred. For births and fetal deaths, residence is defined as the mother's usual place of residence.

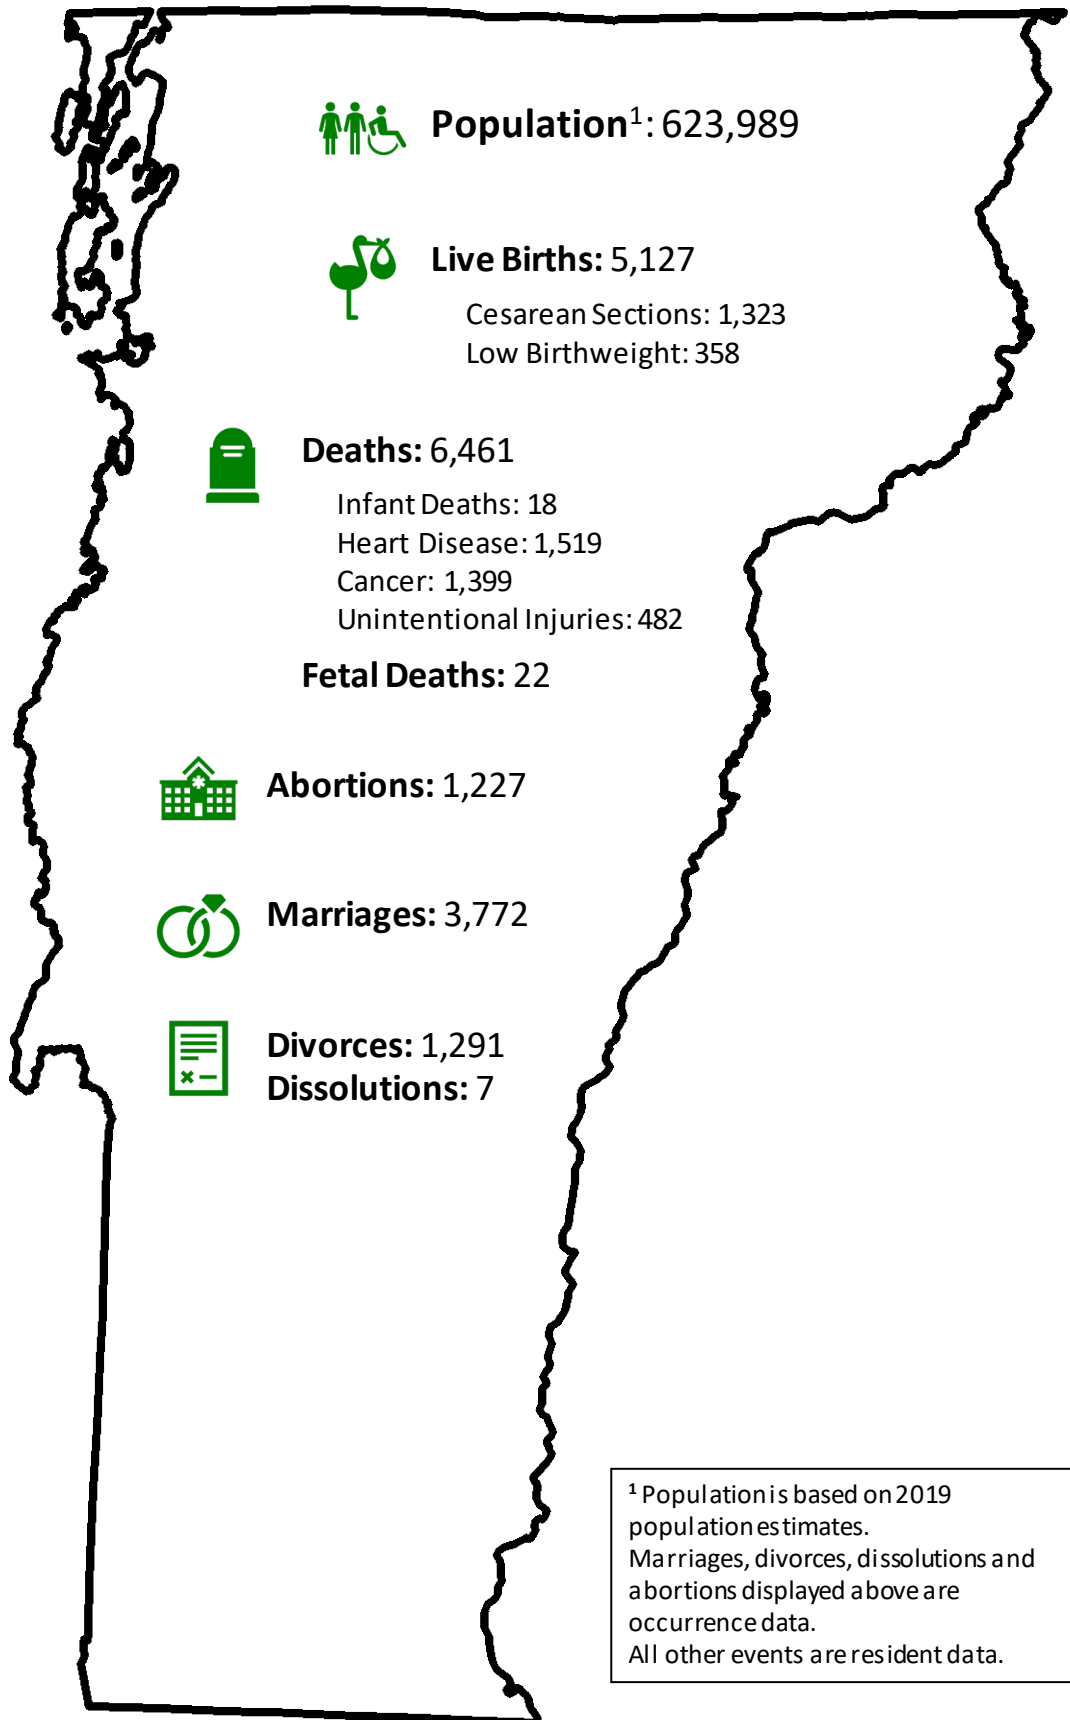

ROW PERCENT: The number of cases in each row expressed as a percentage of all cases in that row.

WEEKS OF GESTATION: The number of weeks elapsed between the first day of the last menstrual period and the date of delivery.

# Summary and Population

FIGURE 2.  
VERMONT VITAL EVENTS FOR 2020

---

## SUMMARY STATISTICS

---

**Occurrence** statistics include all events recorded in Vermont, including those involving visitors living outside Vermont. **Resident** statistics are limited to the events involving people with legal residence in Vermont, including events occurring outside Vermont. In 2020, reports of births and deaths to Vermonters were received from 25 states.

### SUMMARY OF 2020 VITAL EVENTS

	<i>Occurrence Number</i>	<i>Resident Number</i>	<i>Resident Rate</i>
<i>Births</i>	4,953	5,127	8.2/1,000 POPULATION
<i>Deaths</i>	6,177	6,461	10.4/1,000 POPULATION
<i>Natural Increase</i>	N/A	-1,334	(3)
<i>Infant Deaths</i>	21	18	3.5/1,000 LIVE BIRTHS
<i>Fetal Deaths</i>	24	22 <sup>(1)</sup>	4.3/1,000 LIVE BIRTHS AND FETAL DEATHS
<i>Abortions</i>	1,227	1,014 <sup>(1)</sup>	8.9/1,000 POPULATION (WOMEN AGES 15 – 44)
<i>Marriages</i>	3,772	N/A	6.0/1,000 POPULATION <sup>(2)</sup>
<i>Divorces</i>	1,291	N/A	2.1/1,000 POPULATION <sup>(2)</sup>
<i>Dissolutions</i>	7	N/A	(3)

2019 POPULATION: 623,989<sup>(4)</sup>

---

<sup>(1)</sup> Does not include out-of-state occurrences.

<sup>(2)</sup> Based on number of occurrences.

<sup>(3)</sup> Rate less than 1 per 1,000.

<sup>(4)</sup> 2019 population estimates are the most recent data available.

1. Resident data unless otherwise noted.
2. Population is the census population for those years when the census was taken and is the mid-year estimate for non-census years  
NOTE: that mid-year population estimates are revised after each census is taken, so the 1991-1999 and 2001-2009 population figures and rates in this table differ from those presented in older publications.
3. Rate per 1000 population.
4. Rate per 1000 women ages 15-44.
5. Number of pregnancies includes Live Births and Fetal Deaths for 1857-1972, and Live Births, Fetal Deaths, and Abortions for 1973–present.
6. Rate per 1000 Live Births.
7. Events per 1000 Live Births.
8. Data for these years is based on occurrence returns only.
9. 1857 population is the 1860 census population.
10. 1857 was the first year that town clerks were required to report vital events to the Secretary of State and returns for that year are incomplete.
11. 2019 population estimates were used in the 2020 bulletin.
12. Pregnancy counts and rates and abortion ratios between 2000-2019 were corrected and may differ from those presented in older publications.

# BIRTHS

On July 1, 2005, Vermont implemented a revised birth certificate based on the 2003 revision of the U.S. Standard Certificate of Live Birth. Comparisons of Vermont rates to U.S. rates are made when possible. As of 2016, all 50 states and the District of Columbia, and all territories except for American Samoa had adopted the revised birth certificate. In 2020, 5,127 babies were born to Vermont residents. This represents a decrease of 234 births from 2019. The crude birth rate in 2020 is 8.2 per 1,000 Vermont residents, a decrease from the 2019 rate of 8.6. The U.S. birth rate for 2020 was 11.0. The Vermont birth rate peaked in 1955 at 24 per 1,000 residents; it then dropped for two decades, remained relatively stable from the late 1970's through the 1980's, slowly and steadily decreased through the 1990's, and has continued a slow decline since.

## FERTILITY

Although the crude birth rate is based on the total population, a better measure of birth patterns is the fertility rate which is based on the population of women ages 15 through 44, the peak child-bearing years. The 2020 Vermont fertility rate was 44.6 per 1,000 women ages 15 through 44 (Table B-6, Figure 4), a decrease from the 2019 rate of 46.6. The U.S. fertility rate was 56.0 in 2020. The fertility rate in Vermont peaked in 1960 at 126, declined through the 1960's and 1970's, leveled off slightly in the 1980's, steadily declined through the early 90's, remained fairly stable through the early 2000's, and has started to slowly decline again since 2014. Age-specific fertility rates have generally declined among the younger age groups (<30), and increased among the older age groups, with the largest increase among 35–44-year-olds.

FIGURE 4

AGE-SPECIFIC FERTILITY RATES, SELECTED YEARS 1980-2020

AGES/Year	1980	1990	2000	2010	2020
<b>TOTAL</b>	<b>63.3</b>	<b>60.6</b>	<b>49.7</b>	<b>52.5</b>	<b>44.6</b>
15 – 19	38.5	34.1	23.4	17.8	6.9
20 – 24	102.4	93.9	74.1	64.0	34.3
25 – 29	113.0	114.6	102.1	97.2	74.6
30 – 34	60.2	79.5	84.0	101.0	91.7
35 – 44	12.5	19.6	21.3	24.7	33.1

Forty-one percent of births in 2020 were to women in their twenties (Table B-5), down from 49.5 percent in 2010. Women aged 30 and over accounted for over half (55.9%) of births, up from 44.1 percent in 2010 and 43.9 percent in 2000. Women aged 15 through 19 accounted for 2.7 percent of births, down from 6.4 percent in 2010 and 8.0 percent in 2000.

## BIRTH WEIGHT

The median birth weight for all resident births in 2020 was 3,369 grams (approximately 7 pounds 7 ounces). Low birth weight infants are those born weighing less than 2,500 grams (5 pounds 8 ounces). They are much more likely than heavier babies to suffer short and long-term disabilities, and to die in infancy. In 2020, 7.0 percent of Vermont resident births were low birth weight (Table B-12), and 0.8 percent were very low birth weight (under 1,500 grams or 3 pounds 5 ounces). The U.S. low birth weight rate for 2020 was 8.2 percent.

Low birth weight rates in Vermont varied by age group in 2020 (Table B-12), with the highest rates occurring in the youngest age groups. In 2020, the low birth weight rate among women under age 20 was 12.9 percent, compared to 7.6 percent of births among women aged 20-29 and 6.3 percent of births to women aged 30-39, and 5.9 percent of births to women age 40 and older.

Infant birth weight is also positively associated with maternal weight gain: mothers who do not gain adequate weight during pregnancy are more likely to deliver low birth weight infants. On the other hand, there are risks associated with gaining too much weight including delivery complications and maternal and infant obesity. Although the weight gained by 23.1% of Vermont mothers in 2020 fell below the range recommended by the Institute of Medicine, 47.1% gained above the recommended range (Table B-23). Please refer to Appendix B for further information on the guidelines.

The single most important preventable risk factor for low birth weight is smoking during pregnancy. The low birth weight rate among women who smoked cigarettes during their pregnancy was 17.1% compared to 5.3% among women who did not smoke during pregnancy (Table B-19). The rate of women who reported smoking during pregnancy in 2020 was 13.2%, consistent with 13.2% reported in 2019. Among those who smoked before pregnancy or during the first trimester, 25.7% quit, a decrease from the 2019 quit rate of 28.7%.

## PRENATAL CARE

Early, comprehensive, and high quality prenatal care is essential for a healthy pregnancy and birth. Through prenatal care, pregnant women are screened for medical conditions and counseled on nutrition, behavioral risks (such as using tobacco and alcohol), and domestic violence.

In 2020, 84.4% of the babies were born to mothers who began prenatal care in the first three months of pregnancy (Table B-14), down from 85.3% in 2019. In general, the percentage of women receiving first trimester prenatal care has steadily increased since 1987.

The proportion of births in 2020 to Vermont mothers who delayed care to the third trimester or received no prenatal care was 2.6%, up from 1.9% in 2019. As in previous years, the age of the mother is closely associated with the time of entry to prenatal care with young women seeking care later than older women (Table B-15).

Based on the Adequacy of Prenatal Care Utilization (APNCU) Index, in 2020, 84.9% of Vermont resident mothers received at least adequate prenatal care, (Table B-25). The percent of Vermont mothers who received inadequate care was 7.1. Mothers aged 15-19 (10.9%) and aged 20 to 24 (8.8%) had the highest percent of inadequate care, while mothers aged 30 to 34 and aged 35 to 39 had the highest percent of adequate plus intensive care (87.0% and 86.8%, respectively).

## MEDICAL RISK FACTORS

Of those births with medical risk factors reported for the mother, the most common were gestational hypertension, gestational diabetes, and previous pre-term births. The most reported characteristics of labor and delivery were spinal anesthesia during labor, induction of labor, fetal intolerance, augmentation of labor, and antibiotics received by mother during labor (Table B-21).

## DELIVERIES

Of babies born in Vermont hospitals in 2020, 27.6% were delivered by cesarean section (Table B-18) compared to 31.8 percent for U.S. women in 2020. The primary cesarean section rate was 20.4% in Vermont for 2020, lower than the 21.9 percent for U.S. women in 2020. Of mothers delivering in Vermont hospitals in 2020 who had a previous delivery by cesarean section, 25.1% had vaginal births, compared to 13.9 percent for mothers in the U.S. in 2020.

## VERMONT RESIDENT PREGNANCIES

The pregnancy rate is derived by adding live births, fetal deaths, and abortions. The pregnancy rates presented in this report underestimate the actual number of pregnancies for two reasons. First, Vermont resident abortions and fetal deaths that occur out of state are not reported to us. Second, by statute, fetal deaths prior to 20 weeks gestation are not reportable. Since residents of some counties may be more likely to use out-of-state services, the extent of these underestimates may differ among counties.

In 2020, the pregnancy rate in Vermont was 53.8 pregnancies per 1,000 women ages 15 to 44 (Table B-31), a decrease from 55.1 in 2019. Overall, the pregnancy rate peaked at 127.6 in 1960 then dropped steadily through the next four decades to a low of 59.7 in 2001 before moving back above 60 in 2002. The pregnancy rate has started to decline over the past decade (Table A-1).

The 2020 teen pregnancy rate was 10.6 pregnancies per 1,000 women ages 15 to 19 years (Table B-31), a decrease from 11.7 in 2019. In general, the teen pregnancy rate has been decreasing since 1991. In 2020, the highest pregnancy rate was seen in women 30 to 34 years of age at 103.8 followed by the 25 to 29 age group at 89.7. The lowest rate was for teens.

FIGURE 5  
VERMONT AND U.S. BIRTH RATES  
1980-2020

Vermont data points can be found in Table A-1. Data points for the U.S. can be found in Appendix D.

VERMONT AND U.S. CRUDE DEATH RATES  
1980-2020

Vermont data points can be found in Table A-1. Data points for the U.S. can be found in Appendix D.

---

## DEATHS

---

There were 6,461 resident deaths in 2020, 505 more than in 2019. The crude death rate was 10.4 per 1,000/population. The death rate has been increasing since 2004 when the rate was 8.0; prior to then it had been slowly declining from 11.2 in 1960, to 10.0 in 1970, down to 9.0 in 1980 and 8.2 in 1990. The Vermont crude death rate was slightly lower than the U.S. crude death rate from 1988 through 2005 and has been slightly higher than the U.S. crude death rate since 2007 (Figure 8).

From the 1960's through 2006 the two leading causes of death in Vermont were heart disease and cancer, respectively. In 2007 cancer took over as the leading cause of death among Vermonters and has remained such except for 2016 when heart disease briefly overtook cancer as the leading cause of death in Vermont. In 2020, heart disease was once again the leading cause of death in Vermont. Heart disease and cancer accounted for 45.1% of the deaths in 2020 (Table C-11). The heart disease crude death rate peaked in the 1960's at 439.5 deaths per 100,000/population but has decreased significantly since then. The heart disease death rate for 2020 was 243.4 per 100,000/population (Table C-1). In contrast, the crude death rate for cancer (malignant neoplasms) increased steadily since 1980 before leveling off in recent years. The 2020 death rate for cancer was 224.2.

Accidents (or unintentional injuries) had maintained its position as the fourth leading cause of death in Vermont since 2005 before becoming the third leading cause of death in 2016. The crude death rate declined to 31.3 in 1994 to 1996. From the mid 1990's through 2006, the death rate continued to increase, but has leveled off in recent years. The crude rate for 2020 was 77.2 deaths per 100,000/population, increasing from the 2019 rate of 64.4.

Chronic lower respiratory diseases (formerly referred to as chronic obstructive pulmonary diseases) had been the third leading cause of death among Vermont residents since 2005 before dropping to the fourth leading cause of death in 2016. The crude death rate for this cause increased from 33.0 per 100,000/population in the period from 1979 to 1981 to 50.9 in 2000. After declining in 2001 and 2002, the rate has fluctuated since. In 2020, the rate was 55.4 per 100,000/population, up slightly from 54.6 in 2019.

The crude death rate for Alzheimer's disease steadily increased throughout the 1990's, resulting in movement up from the tenth to the seventh leading cause of death in 1999. In 2004, Alzheimer's disease moved up to the sixth leading cause of death and remained there through 2010. In 2011 Alzheimer's moved up to the fifth leading cause of death in Vermont and has maintained that ranking every year except in 2015 when it again ranked sixth. The crude death rate for Alzheimer's disease in 2020 was 44.9 per 100,000/population, down from 50.5 in 2019.

Cerebrovascular diseases, or stroke, dropped from the third leading cause of death in 2004 to the fifth leading cause beginning in 2005. In 2011 cerebrovascular diseases dropped to the sixth leading cause of death in Vermont and has maintained that rank except for 2015 when it temporarily moved back to ranking fifth. The crude death rate for cerebrovascular diseases has dropped significantly from its peak of 131.9 per

100,000/population in the early 1960's to 39.9 in 2017. The 2020 death rate due to Cerebrovascular disease was 42.1.

Diabetes remained the seventh leading cause of death in Vermont in 2020, and the rate fluctuated throughout the last two decades, from 26.9 per 100,000/population in 2000 to 29.6 in 2003, 27.4 in 2007 to 24.0 in 2010, up to 28.4 in 2012, down to 21.8 in 2019 and 24.5 in 2020.

COVID-19 became the eighth leading cause of death in Vermont in 2020. Vermont saw its first COVID-19 death soon after the World Health Organization declared it a global pandemic, with the first reported death in March of 2020. The rise of COVID-19 knocked multiple leading causes down in rankings, including suicide, Parkinson's disease, influenza and pneumonia, chronic liver disease and cirrhosis, and essential hypertension and hypertensive renal disease. The death rate due to COVID-19 was 23.1 per 100,000/population.

Intentional self-harm (suicide) had been the eighth leading cause of death in recent years, now the ninth, and the death rate due to intentional self-harm was 18.8 per 100,000 population.

The tenth leading cause of death in Vermont in 2020 was Parkinson's disease with a crude death rate of 15.9 per 100,000/population. Influenza and pneumonia, which was previously the tenth leading cause, dropped out of the top ten below both chronic liver disease and cirrhosis and essential hypertension and hypertensive renal disease.

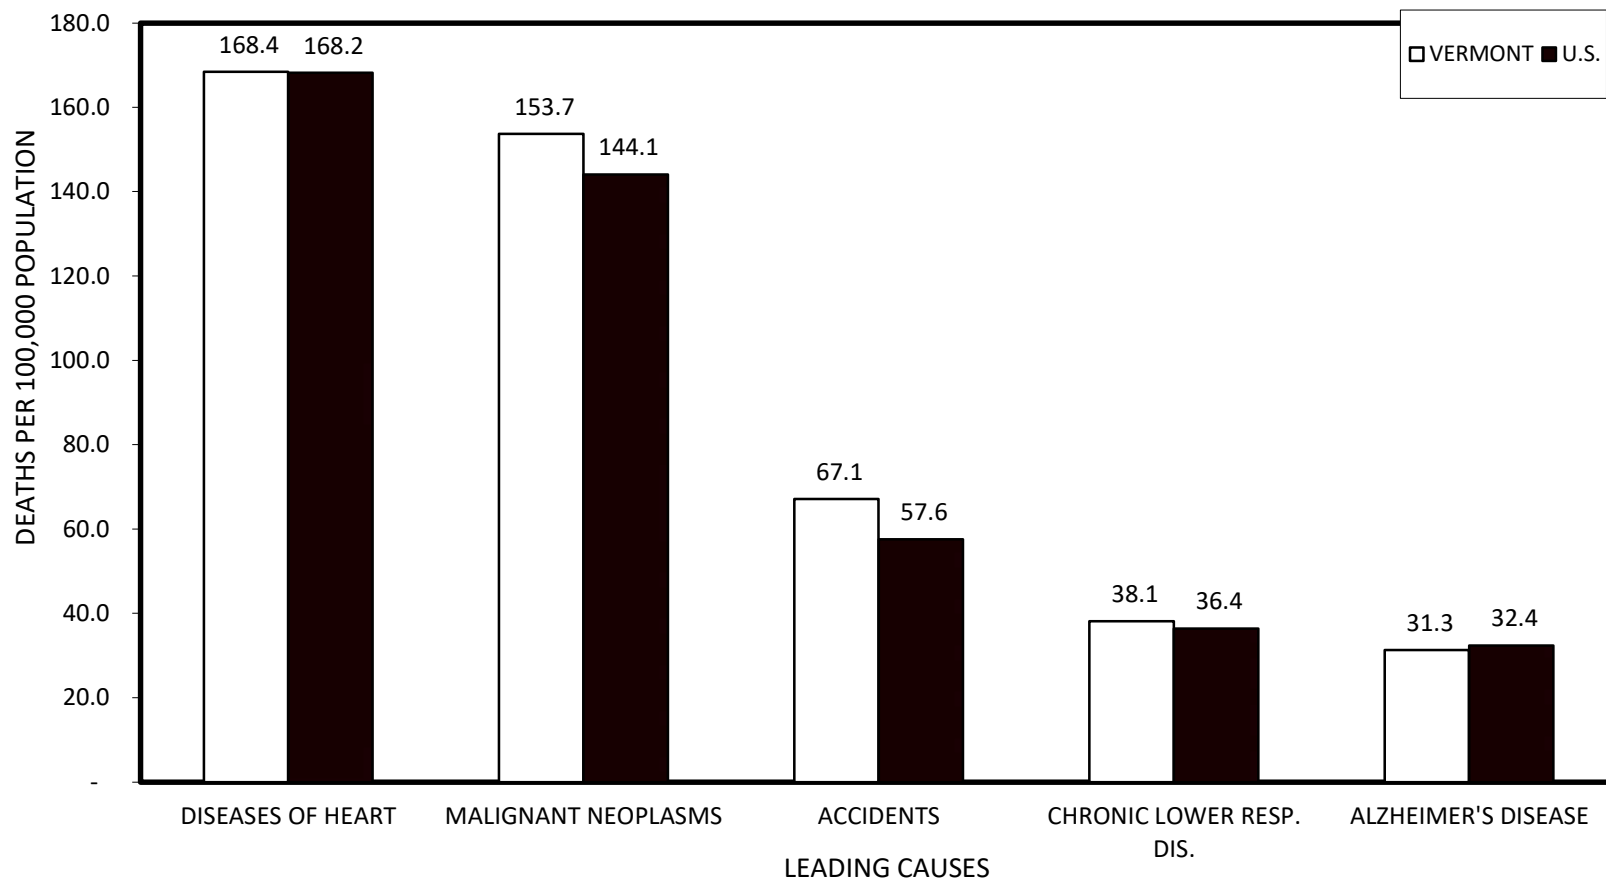

The leading causes of death varied with age (Table C-2 and Table C-14). Unintentional injuries were the leading cause of death for people ages 15 to 44. Cancer was the leading cause of death, followed by heart disease for those ages 55 to 84, and at ages 85 and higher, the causes were reversed with heart disease as the leading cause, followed by cancer.

Death rates dramatically increase after age 75. While people ages 75 and over comprised only 8.0 percent of the total population in 2019, they accounted for 58.5 percent of total deaths in 2020. Aside from accidents, COVID-19, and influenza and pneumonia, the leading causes of death in this age group were all chronic diseases.

The leading causes of death did vary by sex (Table C-1 and Table C-11). Heart disease was the leading cause of death for both men and women, and cancer was the second leading cause for both as well. Accidents were the third leading cause of death for Vermont males, while accidents were the fourth leading cause of death for females. Alzheimer's disease was the third leading cause of death among women but was eighth among men. Men had higher death rates than women due to suicide and diabetes, while women had higher death rates due to cerebrovascular disease, chronic lower respiratory diseases, and Parkinson's disease. The COVID-19 death rate was relatively consistent between sexes, the male death rate due to COVID-19 was 24.0 per 100,000/population and the female death rate was 22.2 per 100,000/population.

Deaths occurring in a hospital accounted for 28.6 percent of 2020 Vermont resident deaths (Table C-17), less than 35.8 percent in 2010, and down from 62 percent in 1980, 53 percent in 1990, and 42 percent in 2000. In 2020, 36.1% of Vermont resident deaths occurred at home and 23.7% occurred in a nursing home or long-term care facility.

FIGURE 9  
FIVE LEADING CAUSES OF DEATH IN VERMONT IN 2020,  
VERMONT AND U.S. RATES

Vermont and U.S. rates in this chart are age-adjusted to the 2000 U.S. standard population for comparison purposes.

<sup>(1)</sup> CAUSE OF DEATH IS CODED BY THE INTERNATIONAL CLASSIFICATION OF DISEASES. DEATHS IN 1979 TO 1998 WERE CODED ACCORDING TO ICD-9. EFFECTIVE JANUARY 1, 1999 DEATHS WERE CODED ACCORDING TO ICD-10. SINCE SIGNIFICANT CHANGES WERE MADE IN ICD-10, THE CODE NUMBERS FOR ICD-9 AND ICD-10 ARE GIVEN IN ADDITION TO COMPARABILITY RATIOS WHICH HAVE BEEN APPLIED TO THE EARLIER RATES TO MAKE THEM COMPARABLE TO THE ICD-10 RATES.

<sup>(2)</sup> RATES ARE BASED ON 2019 POPULATION ESTIMATES.

## NOTES:

<sup>(1)</sup> INCLUDES WATER, AIR SPACE, ANIMAL, AGRICULTURAL, AND UNSPECIFIED VEHICLE TRANSPORT ACCIDENTS, AND SEQUELAE OF SUCH.

<sup>(2)</sup> INCLUDES EXPOSURE TO EXCESSIVE NATURAL COLD, AND LACK OF FOOD OR WATER.

<sup>(3)</sup> INCLUDES EXPOSURE TO OTHER UNSPECIFIED FACTORS.

---

# INFANT DEATHS, FETAL DEATHS, AND ABORTIONS

---

## INFANT DEATHS

In 2020, there were 18 resident infant deaths, which equates to a rate of 3.5 infant deaths per 1,000 live births. This rate is lower than the 2020 U.S. rate of 5.4. The Vermont infant mortality rate steadily declined from 24.0 in 1960 to 5.8 per 1,000 live births in 1991. Over the past two decades the rate has fluctuated between a high of 7.4 in 1994 and a low of 2.8 in 2019 (Table A-1).

Eleven (61 percent) of the infant deaths occurred during the neonatal period, that is before the infant became 28 days old (Table D-3). The neonatal death rate was 2.1 deaths per 1,000 live births (Table D-2), below the 2020 U.S. neonatal death rate of 3.6. The Vermont neonatal death rate decreased from 18.6 in 1960, to 14.4 in 1970, to 6.2 in 1980, to 3.6 in 1990 (Table A-1), then followed an increasing trend through the nineties to a high of 5.9 in 1998. The rate has fluctuated throughout the past two decades.

One of the most important risk factors in infant mortality is low birth weight (Table D-3). Of resident infants who died in 2020, 61% had a birth weight less than 2500 grams (5 pounds 8 ounces), while 7.0 percent of all resident births were low birth weight. The infant mortality rate for low weight births was 30.7 deaths per 1,000 live births.

## FETAL DEATHS

Unlike births and deaths, reports of fetal deaths and abortions are not shared among states. Therefore, statistics concerning these events reflect occurrences in Vermont only and do not include Vermont resident fetal deaths and abortions that occurred in other states.

There were 22 resident fetal deaths in 2020 (Table D-1) for a rate of 4.3 per 1,000 live births and fetal deaths, an increase from 3.5 per 1,000 live births and fetal deaths in 2019 (Table D-2). Of the fetal deaths in Vermont, 15 weighed less than 2500 grams (Table D-3). From 2018 to 2020, the fetal death rate was highest in the 25 to 29 age group: 4.5 per 1,000 live births (Table D-2).

## VERMONT ABORTIONS

There were 1,227 abortions performed in Vermont in 2020, an increase from 1,195 in 2019. Vermont residents accounted for 1,014, or 82.6 percent. This represents a rate of 8.9 per 1,000 Vermont women ages 15 to 44.

The abortion ratio is the number of resident abortions occurring in Vermont times 1,000, divided by the total resident live births. The abortion ratio for 2020 was 197.8 abortions per 1,000 live births, an increase from the 173.4 seen in 2019. The U.S. abortion ratio was 195 per 1,000 live births in 2019. Women ages 25 to 29 had the highest age-specific abortion rate of 14.7 per 1,000 women, followed by women ages 20 to 24 at 12.3.

First trimester abortions (less than or equal to 12 weeks) accounted for 92.2 percent of all Vermont abortions, and 78.2 percent of all Vermont abortions were for pregnancies of less than 9 weeks duration (Table E-5). See Appendix B for the method used to compute the number of weeks of gestation.

**NOTES:**

Fetal and perinatal death rates are the number of resident fetal deaths and perinatal deaths per 1,000 resident live births and fetal deaths.

Neonatal and infant death rates are the number of resident neonatal deaths and infant deaths per 1,000 resident live births.

Data for the years 2018-2020 have been combined to produce more stable rates.

# Marriages and Divorces

FIGURE 12  
 VERMONT AND U.S. MARRIAGE AND DIVORCE RATES  
 1980 - 2020

Data points for the U.S. population can be found in Appendix D. Vermont data points can be found in Table A-1.

---

# MARRIAGES & DIVORCES

---

## MARRIAGES

**NOTE: Marriage between same sex partners became legal in Vermont on September 1, 2009. The tables in this section include marriages between same sex partners and therefore the labels have been changed to reflect the labels used on the revised civil marriage license and certificate: Applicant A and Applicant B.**

In 2020, 3,772 marriages were performed in Vermont, 1,049 fewer than in 2019. The 2020 Vermont marriage rate was 6.0 per 1,000 Vermont resident population, higher than the 2020 U.S. rate of 5.1. Marriages between two out-of-state residents accounted for 25.9 percent of the marriages in Vermont (Table F-2).

There was the usual seasonal variation with more marriages occurring in the fall than in any other season. October (677), September (653), and August (620) were the most popular months for marriages in 2020 (Table F-5).

More than half (59.4 percent) of the marriages were firsts for both applicants (Table F-4). For Applicant B, 69.1 percent were first marriages, and for Applicant A, 69.1 percent were first marriages. Remarriages for both applicants accounted for 20.8 percent of marriages in Vermont.

Civil ceremonies accounted for 65.4 percent of marriages in 2020 (Table F-6).

## DIVORCES

There were 1,291 divorces granted in 2020, 477 fewer than in 2019. This represents a rate of 2.1 per 1,000 residents, slightly lower than the 2020 U.S. rate of 2.3.

The median length of marriages ending in divorce was 9 years, with a range of 5 months to 66 years. The median age at the time of divorce was 43 for Applicant A with a range of 20 to 85 years. The median age at the time of divorce was 44 for Applicant B, with a range of 20 to 84 years (Table G-2).

## OBSTETRIC DATES AND INTERVALS AND WEIGHT GAIN RECOMMENDATIONS

### MONTH PRENATAL CARE BEGAN

Since 1988, the Vermont Department of Health has used the National Center for Health Statistics method of calculating the month prenatal care began. This allows Vermont data to be more easily compared to national data, and eliminates any errors that could be introduced by hospitals using different reporting methods.

The calculation for month prenatal care began changed at the national level with the 2003 Revision of the U.S. Standard Certificate of Live Birth. Vermont implemented its' new birth certificate on July 1, 2005, based on the 2003 Revision of the U.S. Standard, so the Department of Health began using the new calculation in 2005. The new calculation converts to century dates the date of last menses and the date of the first prenatal visit, determines the difference in number of days between these dates, and then converts the days to months of pregnancy. For example, if the date of last menses was March 15, 2005 and the date of the first prenatal visit was June 30, 2005, then the difference is 107 days which means that prenatal care began in the fourth month.

Please note that this change in calculation affects the rate of entry into first trimester prenatal care. Analysis done by the Vermont Department of Health shows that this change in calculation reduces the rate of entry into first trimester prenatal care by about 7%, so rates for years 2005 and later should not be compared to rates for prior years.

### GESTATIONAL AGE

**Live Births and Fetal Deaths:** The methodology used to determine gestational age matches that used by the National Center for Health Statistics.

Two measures of gestational age are available from the standard certificates. The standard certificates collect information on the first day of the mother's last menstrual period (LMP). The interval between the LMP and the date of birth is the *calculated* gestational age. The standard certificate also collects a *clinical estimate* of gestation.

The primary measure used by NCHS to determine the gestational age of the newborn was previously the *calculated* weeks of gestation, supplemented by an algorithm that determined if the calculated gestational age and birth weight were compatible, and the clinical estimate of gestational age may replace the calculated age in some cases. However this method is subject to error due to imperfect maternal recall and to misidentification of the LMP. Therefore, beginning in 2014 the clinical estimate of gestational age is assigned as the gestational age in all cases.

**Abortions:** Gestational age is calculated from the date of last normal menses and date of abortion. The clinically estimated weeks is used if the date of last normal menses is unknown, or if the calculated weeks and the clinically estimated weeks are more than two weeks apart.

# WEIGHT GAIN DURING PREGNANCY

The weight gain guidelines reflected in this report were taken from “Weight Gain During Pregnancy: Reexamining the Guidelines” Institute of Medicine, National Academies Press, 2009. The recommendations are as follows for singleton, full term births:

<i>PRE-PREGNANCY BMI</i>	<i>RECOMMENDED WEIGHT GAIN</i>
< 18.5	28 - 40 LBS
18.5 - 24.9	25 - 35 LBS
25.0 - 29.9	15 - 25 LBS
> 30.0	11 - 20 LBS
