Vermont Vital Statistics Annual Report

2005

State of Vermont
James H. Douglas, Governor

Agency of Human Services
Cynthia D. LaWare, Secretary

Department of Health
Wendy S. Davis, MD, Commissioner

September 2008

Printed on recycled paper.

We gratefully acknowledge the contributions of the medical records staff, physicians and midwives, funeral directors, lawyers, and court clerks for their help in collecting and providing us with this data.

We also recognize the 251 town and city clerks, who are our local registrars. Without them, these analyses of Vermont's vital statistics would not be possible.

Introduction

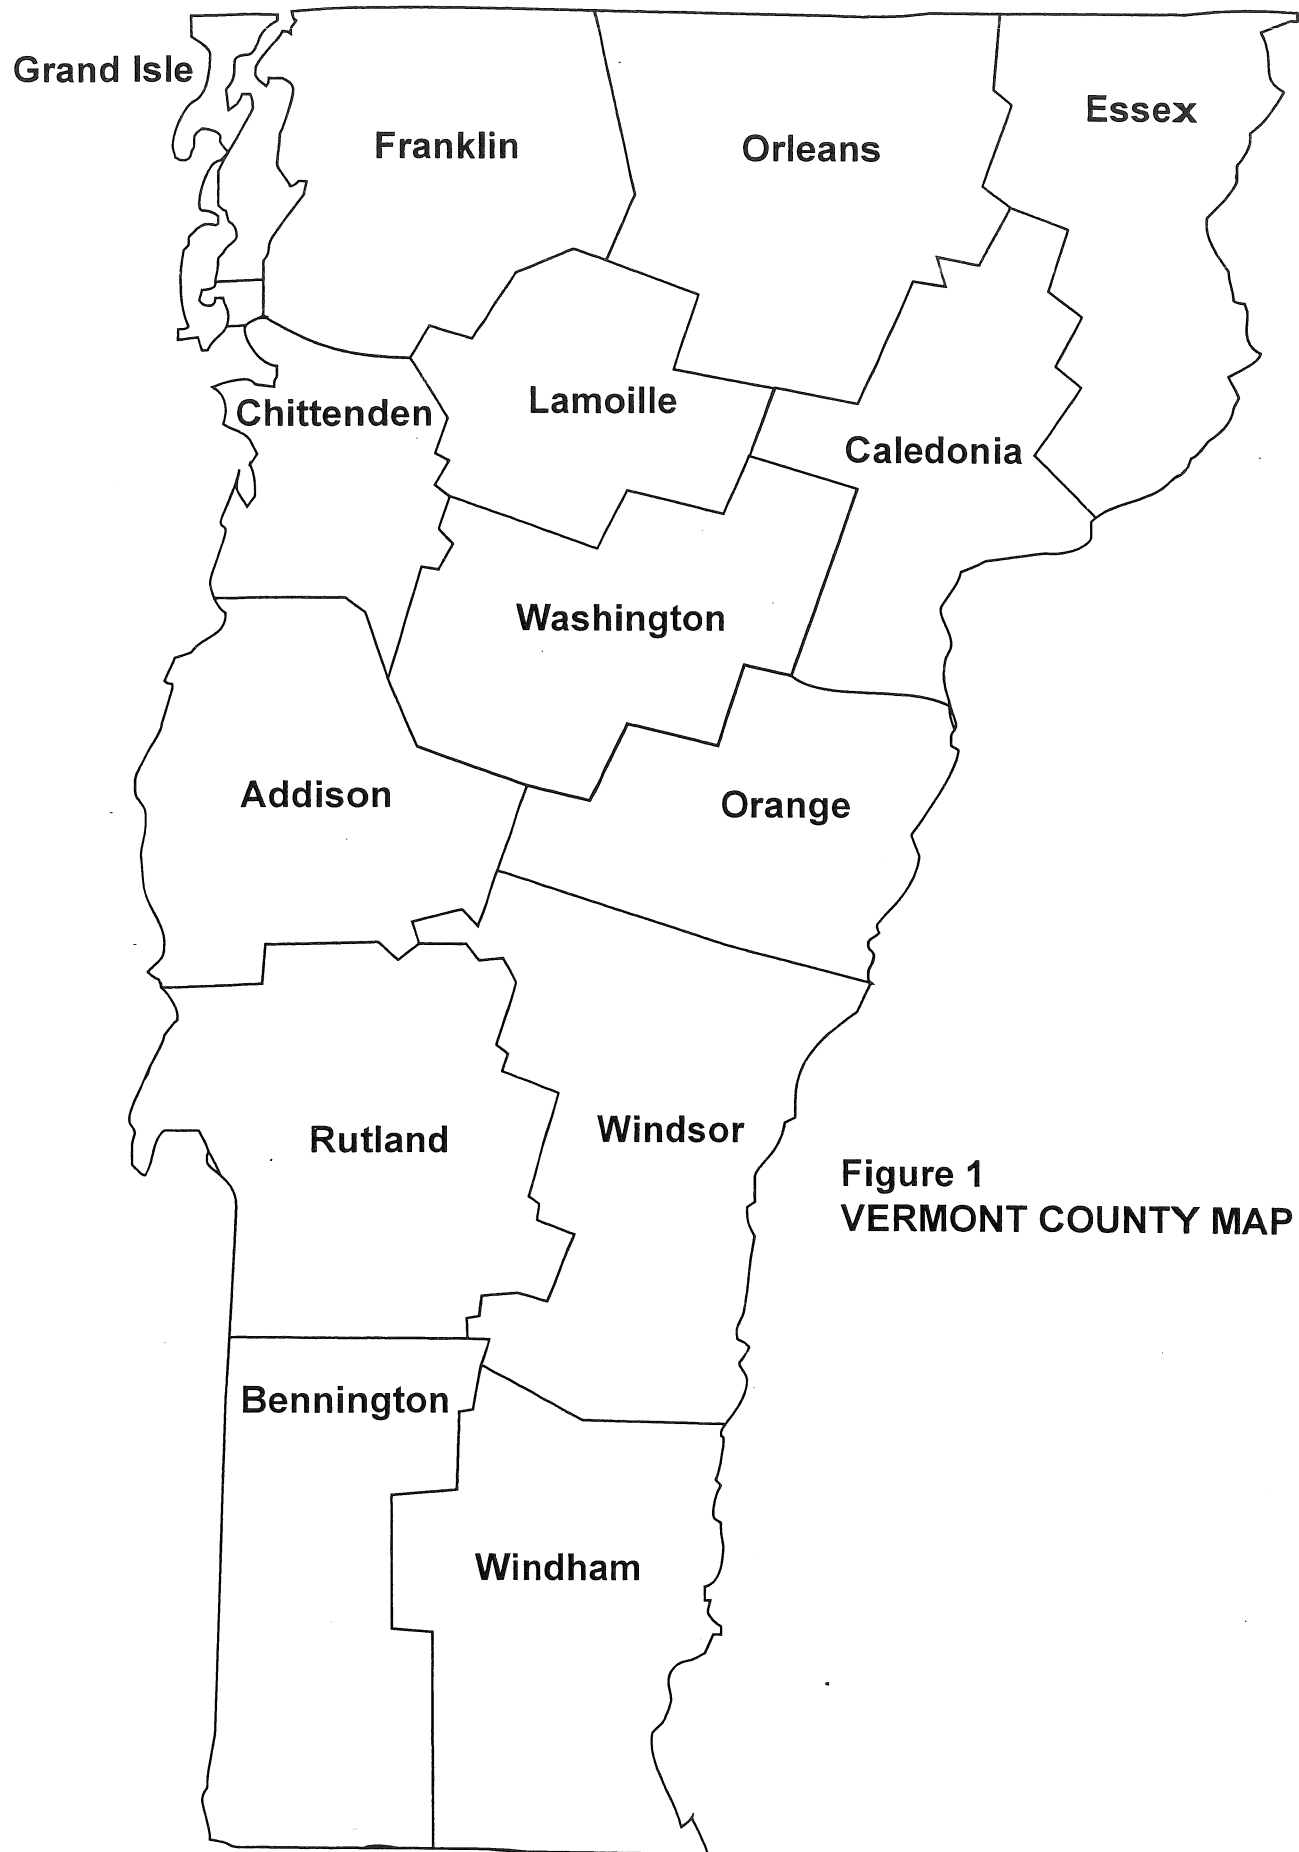

Figure 1
VERMONT COUNTY MAP

THE VERMONT VITAL STATISTICS SYSTEM

Statewide vital registration began in Vermont in 1857, when the General Assembly passed a bill requiring that towns report all births, marriages, and deaths occurring in their jurisdiction to the Secretary of State. The legislature also required periodic publication of tables from the reports. This volume is the latest in a series of publications begun in 1857. Historically, the information contained on vital records has served as an important tool for public health officials and others by providing a picture of the general health of the population. Recognizing its importance, in 1896 the Legislature transferred responsibility for the vital statistics system to the newly formed Board of Health, the forerunner of the Vermont Department of Health. The Health Department has retained this responsibility to the present day.

The Vermont vital statistics system monitors the following vital events: births, deaths, marriages and civil unions, divorces and dissolutions, fetal deaths, and abortions. Each type of vital record follows a different path before being used to produce the statistics published here.

Births: When a birth occurs, the physician, midwife, or other birth attendant is required to complete a birth certificate and file it with the town clerk in the town of birth within 10 days. For hospital births, it is usually the medical records staff that completes the birth certificate. The completed birth certificate is recorded and filed in the town where the birth took place, and a certified copy is sent to the Health Department.

Deaths: Although a physician is responsible for filing the death certificate, the job may be, and often is, delegated to the funeral director. Most of the information needed to complete the death certificate is obtained from the family of the deceased. A physician, however, must complete the cause of death information and sign the death certificate. The funeral director files the completed certificate with the town clerk who sends a certified copy to the Health Department.

Marriages and civil unions: When a couple wishes to marry or establish a civil union in Vermont, they provide a town clerk with the information needed to complete the license. The couple takes the license to an officiant, who signs and dates it, and returns it to the town clerk. The town clerk records and files the certificate, and sends a certified copy to the Health Department.

Divorces and dissolutions: A divorce certificate or certificate dissolving a civil union is initiated by a lawyer or other individual handling the divorce or dissolution. The certificate is filed with the court as part of the divorce or dissolution proceedings. The court keeps the certificate until the decree becomes final, usually three months after the court hearing. When the decree is final, the court clerk signs the certificate and sends it to the Health Department for filing.

Fetal deaths and abortions: Reports of fetal death and induced termination of pregnancy (abortion) are sent directly to the Health Department by the physician, hospital, or clinic that performs the procedure. By law, these reports are for statistical purposes only, are not public records, and are destroyed after five years.

In addition to receiving copies of vital records from Vermont town clerks, the Health Department also receives copies of certificates of all Vermont resident births and deaths that occur in other states and in Canada. This allows the Department to do statistical analyses of vital events involving Vermont residents even if the birth or death occurred outside of the state. Health Department staff code and enter all vital records received into a computerized database. Records with unknown or unlikely data are corrected after querying the data provider. A data file containing statistical information from the records is sent to the National Center for Health Statistics to become part of a national database.

EXPLANATORY NOTES

1. The tables in this bulletin were derived from records of vital events filed at the Vermont Department of Health for calendar year 2005.
2. Rates are based on the 2005 population estimates produced by the Vermont Department of Health.
3. Caution must be used in comparing rates due to the small population in Vermont and the small number of events recorded.
4. Rate comparisons throughout are made to the U.S. white (Hispanic and non-Hispanic) population rather than entire U.S. population. This is because only 3.2 percent of the Vermont population was non-white as of the 2000 U.S. Census.
5. If you have questions about the information found in this bulletin, you may contact a statistician at the Vermont Department of Health, 802-863-7300.
6. If you have questions about the population figures found in this bulletin, you may call the Vermont Department of Health to request a copy of The Population and Housing Estimates, which also provides information about age groups other than those presented in this publication.
7. The following is a list of Vermont's counties and the county abbreviations that are used in this bulletin.

Addison	ADD	Lamoille	LAM
Bennington	BEN	Orange	ORG
Caledonia	CAL	Orleans	ORL
Chittenden	CHI	Rutland	RUT
Essex	ESS	Washington	WAS
Franklin	FRA	Windham	WDM
Grand Isle	GI	Windsor	WDR

DEFINITIONS, RATES, AND RATIOS

ABORTION: The purposeful interruption of an intrauterine pregnancy with the intention other than to produce a live-born infant or other than to remove a dead fetus, and which does not result in a live birth.

ABORTION RATE: Number of resident abortions occurring in Vermont x 1000, divided by the total resident women ages 15 to 44.

ABORTION RATIO: Number of resident abortions occurring in Vermont x 1000, divided by the total resident live births.

AGE ADJUSTMENT: Age adjusting allows one to compare rates among populations having different age distributions by adjusting the crude rates in each population to a standard population base. In this bulletin, county rates are adjusted using the state population distribution as the standard.

The computation formula is: The sum of (age-specific rate for each age group x standard population in that age group) multiplied by 1000, and then divided by the total standard population.

AGE-SPECIFIC DEATH RATE: Number of resident deaths in a specific age group x 1000, divided by the total resident population in a specific age group (using population estimates as of July 1).

AGE-SPECIFIC FERTILITY RATE: Number of resident live births to mothers in a specific age group x 1000, divided by the total resident female population in a specific age group (using population estimates as of July 1).

AGE-SPECIFIC PREGNANCY RATE: Number of resident pregnancies to women in a specific age group x 1000, divided by the total resident female population in a specific age group (using population estimates as of July 1).

ANNULMENT: The invalidation or voiding of a marriage, or civil union, which confers on the parties the status of never having been married to each other.

CIVIL UNION: A civil union is a legal relationship that provides for same-sex couples in Vermont all the benefits, protections, and responsibilities under law as are granted to spouses in a marriage.

CIVIL UNION RATE: Total number of civil unions x 1000, divided by the total resident population (using population estimates as of July 1).

CRUDE BIRTH RATE: Number of resident live births x 1000, divided by the total resident population (using population estimates as of July 1).

CRUDE DEATH RATE: Number of resident deaths x 1000, divided by the total resident population (using population estimates as of July 1).

CUMULATIVE ROW PERCENT: The total number of cases in the current column plus each previous column in each row, expressed as a percentage of all cases in that row.

DEATH: The permanent disappearance of any evidence of life at any time after live birth.

DIVORCE: The final legal dissolution of a marriage.

DIVORCE RATE: The sum of the number of divorces and annulments x 1000; divided by the total resident population, (using population estimates as of July 1).

DISSOLUTION: The final legal dissolution of a civil union.

FERTILITY RATE: Number of resident live births to women ages 15 to 44 x 1000, divided by the total resident female population ages 15 to 44 (using population estimates as of July 1).

FETAL DEATH: A reportable fetal death is a death prior to the complete expulsion or extraction from the mother of a product of conception, which has passed through at least the 20th week of gestation or weighs more than 400 grams; the death is indicated by the fact that, after such expulsion or extraction, the fetus does not breathe or show any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles. Heartbeats are to be distinguished from transient cardiac contractions; respirations are to be distinguished from fleeting respiratory efforts or gasps.

FETAL DEATH RATE: Number of resident fetal deaths x 1000, divided by the total resident live births and resident fetal deaths.

FETAL DEATH RATIO: Number of resident fetal deaths divided by total resident live births.

INFANT DEATH: Death occurring in the first year of life.

INFANT DEATH RATE: Number of resident infant deaths x 1000, divided by the total resident live births.

LIVE BIRTH: The complete expulsion or extraction from the mother of a product of conception, irrespective of the duration of pregnancy, which, after such expulsion or extraction, breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of the voluntary muscles whether or not the umbilical cord has been cut or the placenta is attached. Heartbeats are to be distinguished from transient cardiac contractions; respirations are to be distinguished from fleeting respiratory efforts or gasps.

LOW BIRTH WEIGHT: A baby weighing less than 2,500 grams (5 pounds, 8 ounces) at birth.

LOW BIRTH WEIGHT PERCENT: The number of live births weighing less than 2,500 grams divided by the total number of live births.

MARRIAGE: The legal union of persons of opposite sex.

MARRIAGE RATE: Number of marriages x 1000, divided by the total resident population (using population estimates as of July 1).

NATURAL INCREASE: Occurs when the number of births is greater than the number of deaths.

NEONATAL DEATH: Death of a live-born infant before the infant becomes 28 days old (up to and including 27 days, 23 hours, 59 minutes from the moment of birth).

NEONATAL DEATH RATE: Number of resident neonatal deaths x 1000, divided by the total resident live births.

OCCURRENCE: The place where the event actually occurred.

PERINATAL DEATH: A fetal death or a death occurring before the infant becomes seven days old (up to and including six days, 23 hours, 59 minutes from the moment of birth).

PERINATAL DEATH RATE: Number of resident perinatal deaths x 1000, divided by the total resident live births and resident fetal deaths.

PLURALITY: The number of siblings born as a result of this pregnancy.

PREGNANCY RATE: Number of resident pregnancies in women ages 15 to 44 x 1000, divided by the total resident female population ages 15 to 44.

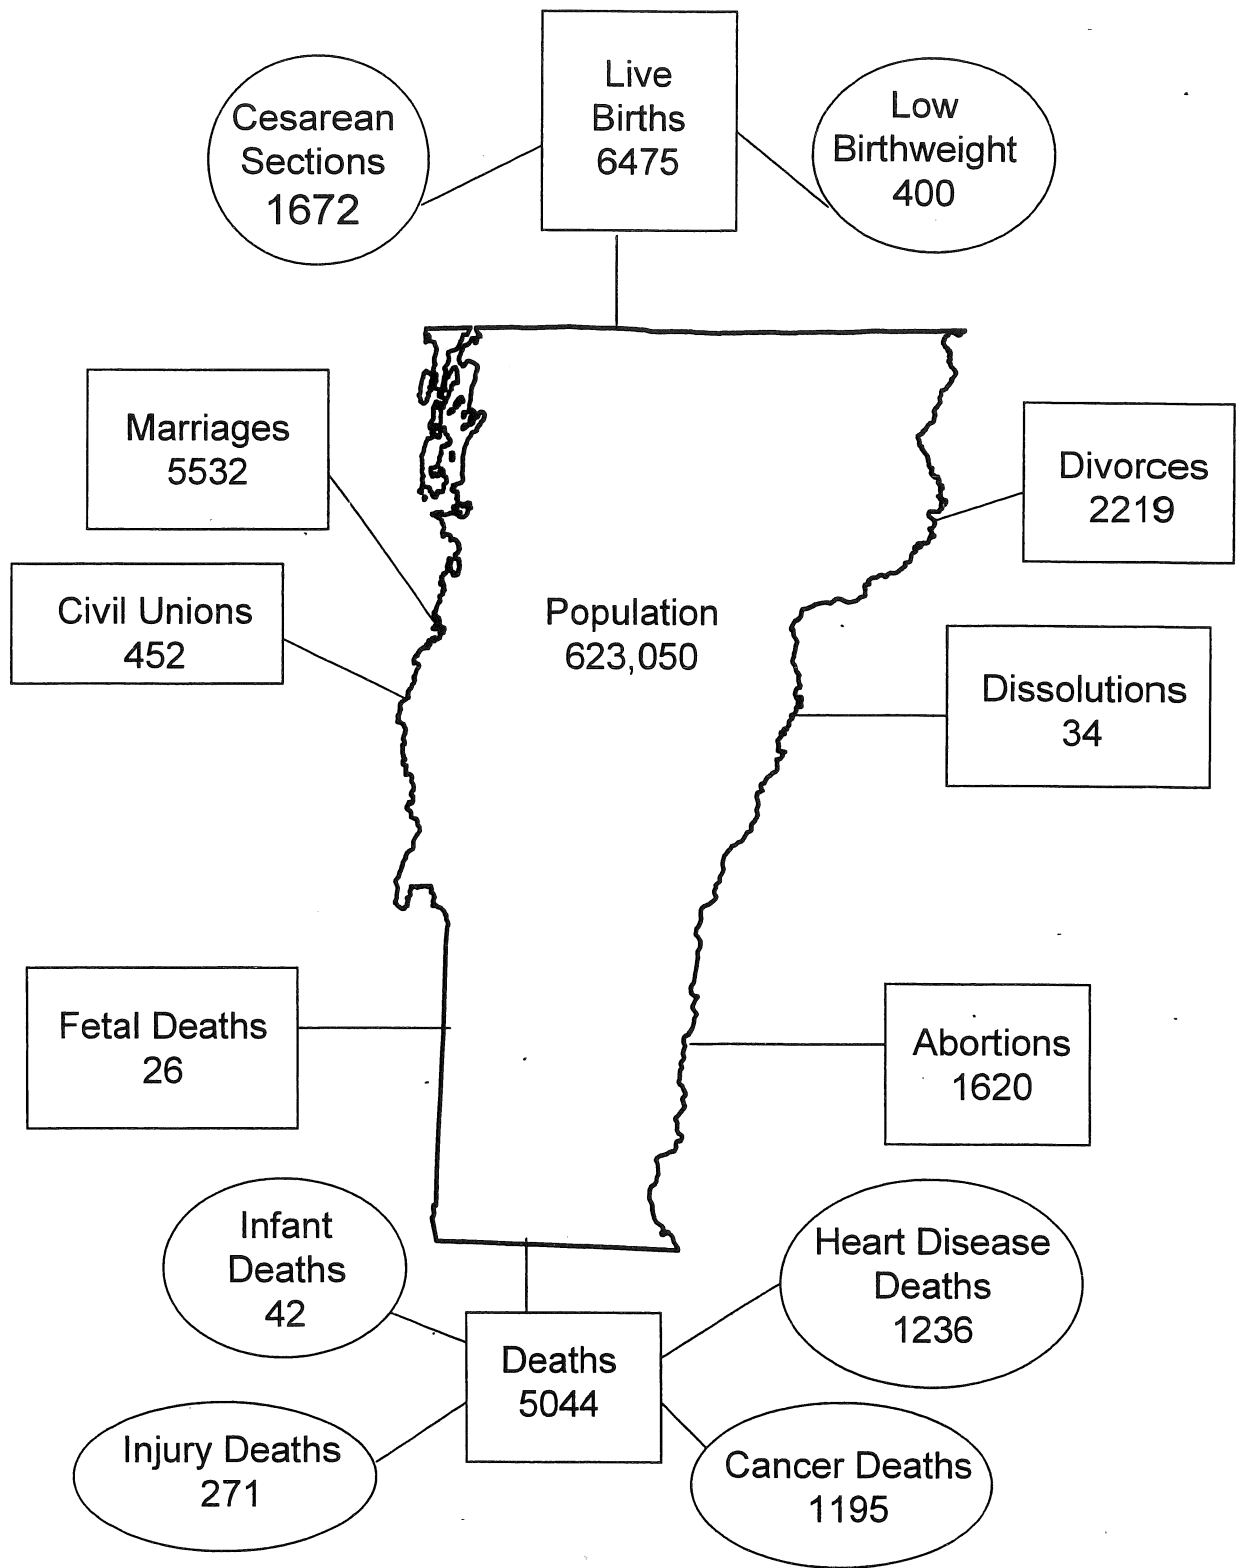

RESIDENCE: The usual place of residence for the person to whom the event occurred. For births and fetal deaths, residence is defined as the mother's usual place of residence.

ROW PERCENT: The number of cases in each row expressed as a percentage of all cases in that row.

WEEKS OF GESTATION: The number of weeks elapsed between the first day of the last menstrual period and the date of delivery.

Summary and Population

Figure 2.
Vermont Vital Events for 2005

Marriages, divorces, civil unions, dissolutions and abortions displayed above are occurrence data. All other events are resident data.

SUMMARY STATISTICS

Occurrence statistics include all events recorded in Vermont, including those involving visitors living outside Vermont. **Resident** statistics are limited to the events involving people with legal residence in Vermont, including events occurring outside Vermont. In 2005, reports of births and deaths to Vermonters were received from 25 states and Canada.

SUMMARY OF 2005 VITAL EVENTS

	<u>Occurrence Number</u>	<u>Resident Number</u>	<u>Resident Rate</u>
Births	6,139	6,475	10.4/1,000 population
Deaths	5,099	5,044	8.1 /1,000 population
Natural Increase	N/A	1,431	2.3 /1,000 population
Infant Deaths	39	42	7.4 /1,000 live births
Fetal Deaths	32	26 ⁽¹⁾	4.0 /1,000 live births and fetal deaths
Abortions	1,620	1,448 ⁽¹⁾	11.4 /1,000 population (women ages 15 to 44)
Marriages	5,532	N/A	8.9 /1,000 population ⁽²⁾
Divorces	2,219	N/A	3.6 /1,000 population ⁽²⁾
Civil Unions	452	N/A	0.7 /1,000 population ⁽²⁾
Dissolutions	34	N/A	⁽³⁾

2005 population: 623,050

-
- (1) Does not include out-of-state occurrences
 - (2) Based on number of occurrences
 - (3) Rate less than 1

POPULATION

Vermont's population in 2005 was estimated at 623,050. This was a 2.3 percent increase from the 2000 Census count of 608,827, and an increase of 1,656 people from the 2004 estimate of 621,394.

The age-sex distribution of Vermont is illustrated in Figure 3. The largest segment of the population is the 40 to 49 year old age group, and the fastest growing segment of the population is the 45-64 year old age group. The sex distribution of Vermonters shows males outnumbered females up to age 29, and females slightly outnumbered males from age 30 to 69. After age 70, females outnumbered males by an increasing margin.

The 2005 population estimates were produced by the Vermont Department of Health. They are a slight modification of the Bridged-Race Postcensal Estimates produced for the National Center for Health Statistics by the United States Bureau of the Census.

Figure 3. Population Age-Sex distribution of Vermont, 2005.

1. Resident data unless otherwise noted.
2. Population is the census population for those years when the census was taken and is the mid-year estimate for non-census years
NOTE: that mid-year population estimates are revised after each census is taken, so the 1991-1999 population figures and rates in this table differ from those presented in older publications.
3. Rate per 1000 population.
4. Rate per 1000 women ages 15-44.
5. Number of pregnancies includes Live Births and Fetal Deaths for 1857-1972, and Live Births, Fetal Deaths, and Abortions for 1973 - present.
6. Rate per 1000 Live Births.
7. Events per 1000 Live Births.
8. Data for these years is based on occurrence returns only.
9. 1857 population is the 1860 census population.
10. 1857 was the first year that town clerks were required to report vital events to the Secretary of State and returns for that year are incomplete.

BIRTHS

NOTE: On July 1, 2005 Vermont implemented a revised birth certificate based on the 2003 revision of the U.S. Standard Certificate of Live Birth. The revised certificate included a number of changes to what is reported to the Health Department; therefore, some tables in this report were modified, and explanations are provided in footnotes. Substantial changes which affected trends in data are explained in more detail throughout this text. Comparisons to U.S. white rates are made when possible, but in some cases comparisons can only be made to the other 12 states who also revised their birth certificates in 2005, or earlier. Those states will be referred to as the "revised states".

In 2005, 6,475 babies were born to Vermont residents. This represents a decrease of one hundred twenty-two births from 2004, and it's the first decrease in four years. Until 2002, the number of babies born to Vermont residents had declined every year since 1989. The crude birth rate in 2005 is 10.4 per 1,000 Vermont residents, down from 10.6 in 2004. The U.S. white birth rate for 2005 was 13.4. Comparisons are made to the U.S. white rate because 96.4 percent of Vermont resident births were to white mothers in 2005 (Table B-5). The Vermont birth rate peaked in 1955 at 24 per 1,000 residents; it then dropped for two decades, remained relatively stable from the late 1970's through the 1980's, and slowly and steadily decreased through the 1990's before stabilizing in recent years.

FERTILITY

Although the crude birth rate is based on the total population, a better measure of birth patterns is the fertility rate which is based on the population of women ages 15 through 44, the peak child-bearing years. The 2005 Vermont fertility rate was 50.8 per 1,000 women ages 15 through 44 (Table B-8), a slight decrease from the 2004 rate of 51.9. The U.S. white fertility rate was 66.3 in 2005. The fertility rate in Vermont peaked in 1960 at 126, declined through the 1960's and 1970's, leveled off slightly in the 1980's, steadily declined through the early 90's, and has remained fairly stable since 1995. Age-specific fertility rates have generally declined among the younger age groups (<30), and increased among the older age groups, with the largest increase among 30-34 year olds.

FIGURE 5
AGE-SPECIFIC FERTILITY RATES, SELECTED YEARS 1980-2005

AGES/ YEAR	1980	1990	2000	2005
TOTAL	63.3	60.6	49.7	50.8
15 - 19	38.5	34.1	23.4	19.4
20 - 24	102.4	93.9	74.1	65.1
25 - 29	113.0	114.6	102.1	99.3
30 - 34	60.2	79.5	84.0	97.5
35 - 44	12.5	19.6	21.3	23.4

Just about half of all births (50.3 %) in 2005 were to women in their twenties (Table B-7), down from 56.1 percent in 1990. Women age 30 and over accounted for 42.8 percent of births, up from 42.6 in 2004, and up from 35.4 percent in 1990. Women age 15 through 19 accounted for 6.7 percent of births, down from 7.1 in 2004, and down from 8.5 percent in 1990.

BIRTH WEIGHT

The median birth weight for all resident births in 2005 was 3,430 grams (7 pounds, 9 ounces). Low birth weight infants are those born weighing less than 2,500 grams (5 pounds 8 ounces). They are much more likely than heavier babies to suffer short and long term disabilities, and to die in infancy. In 2005, 6.2 percent of Vermont resident births were low birth weight ([Table B-16](#)) and 1.2 percent were very low birth weight (less than 1,500 grams or 3 pounds 5 ounces). The U.S. white low birth weight rate for 2005 was 7.2 percent. The Vermont low birth weight rate remains above the *Healthy Vermonters 2010* goal of 5.0 percent and the very low birth weight rate is slightly above the *Healthy Vermonters 2010* goal of 0.9 percent.

Low birth weight rates vary by age groups ([Table B-16](#)): in Vermont the low birth weight rate among women under age 20 was 7.6 percent, compared to 6.0 percent of births among women age 20-29 and 6.1 percent of births among women age 30 and older.

Infant birth weight is also positively associated with maternal weight gain: mothers who do not gain adequate weight during pregnancy are more likely to deliver low birth weight infants. On the other hand, there are risks associated with gaining too much weight including delivery complications, maternal and infant obesity. Although the weight gained by 19.6 percent of Vermont mothers in 2005 fell below the range recommended by the Institute of Medicine, 47.7 percent gained above the recommended range ([Table B-31](#)). Please refer to [Appendix B](#) for further information on the guidelines.

The single most important preventable risk factor for low birth weight is smoking during pregnancy. The low birth weight rate among women who smoked cigarettes during their pregnancy was 10.8 percent compared to 5.2 percent among women who did not smoke during pregnancy ([Table B-28](#)). The rate of women who reported smoking during pregnancy in 2005 was 18.5 percent, down slightly from 19.7 percent in 2004. Among those who smoked before pregnancy or during the first trimester, 27.4 percent quit.

PRENATAL CARE

Early, comprehensive, and high quality prenatal care is essential for a healthy pregnancy and birth. Through prenatal care, pregnant women are screened for medical conditions and counseled on nutrition, behavioral risks (such as using tobacco and alcohol), and domestic violence.

In 2005, 84.1 percent of the babies were born to mothers who began prenatal care in the first three months of pregnancy ([Table B-20](#)). Though this is a decrease from 90 percent in 2004 (which was at the *Healthy Vermonters 2010* goal), these rates are not directly comparable. The calculation for month prenatal care began was changed in 2005 with the implementation of the new birth certificate. Analysis by the Vermont Department of Health shows that change in calculation for month prenatal care began reduces the rate of entry into first trimester prenatal care by about 7 percent. Please refer to [Appendix B](#) for more information. In general, the percentage of women receiving first trimester prenatal care has steadily increased since 1987. Vermont's rate in 2005 was higher than the 77.2 percent experienced by non-Hispanic white mothers in the 12 states who also revised their birth certificates.

The proportion of births in 2005 to Vermont mothers who delayed care to the third trimester or received no prenatal care was 2.6 percent, up from 1.5 percent in 2004. Again, these rates are not directly comparable due to the change in calculation of month prenatal care began. The proportion of women receiving late or no prenatal care in 2005 was 4.9 percent for non-Hispanic white mothers in the other revised states. As in previous years, the age of the mother is closely associated with the time of entry to prenatal care with young women seeking care later than older women.

Based on the APNCU Index, in 2005, 87.2 percent of Vermont resident mothers received at least adequate prenatal care, ([Table B32](#)). The percent of Vermont mothers who received inadequate care was 8.1. Teen mothers had the highest percent of inadequate care (15.3 percent) while mothers 30 and older had the highest percent of adequate plus intensive care (90.3 percent). U.S. rates for these characteristics are not available for comparison.

MEDICAL RISK FACTORS

The biggest changes to the revised birth certificate were in the medical section. The lists of items in the pregnancy risk factors and complications of labor and delivery sections were modified and some wording was changed to obtain better information about the most prevalent risk factors and about the conditions that may be present during labor and delivery. Because of these changes and the fact that Vermont implemented the new birth certificate on July 1st, only items that are comparable between birth certificate revisions are presented in this report ([Table B-29](#)).

Of those births with medical risk factors reported, the most common were gestational hypertension and gestational diabetes. The most common characteristics of labor and delivery were induction of labor and premature rupture of membranes.

DELIVERIES

The format and wording of the Method of Delivery item was changed on the revised birth certificate, and preliminary analyses done by the National Center for Health Statistics indicate that “although data on total cesarean delivery appear very comparable, data on VBAC [vaginal birth after cesarean delivery], primary, and repeat cesarean deliveries are not directly comparable between revisions...”⁽¹⁾ Of babies born in Vermont hospitals in 2005, 26.9 percent were delivered by cesarean section ([Table B-27](#)) compared to 29.2 percent for U.S. white women in 2005. The primary cesarean section rate was 17.1 percent in Vermont for 2005, lower than the 24.5 percent for non-Hispanic white mothers in the revised states in 2005. Of mothers delivering in Vermont hospitals in 2005 who had a previous delivery by cesarean section, 13.5 percent had vaginal births, compared to 9.6 percent for non-Hispanic white mothers in the revised states in 2005.

(1) ACCORDING TO THE ADEQUACY OF PRENATAL CARE UTILIZATION INDEX DEVELOPED
BY MILTON KOTELCHUCK, Ph.D, M.P.H.

- INTENSIVE : PNC BEGUN BY MONTH 4 AND \geq 110% OF EXPECTED VISITS WERE RECEIVED.
- ADEQUATE : PNC BEGUN BY MONTH 4 AND 80-109% OF EXPECTED VISITS WERE RECEIVED.
- INTERMEDIATE : PNC BEGUN BY MONTH 4 AND 50-79% OF EXPECTED VISITS WERE RECEIVED.
- INADEQUATE : PNC BEGUN AFTER MONTH 4 OR $<$ 50% OF EXPECTED VISITS WERE RECEIVED.

(2) MAY NOT ADD TO 100% DUE TO ROUNDING.

Deaths

Figure 9
VERMONT AND U.S. WHITE CRUDE DEATH RATES
1955-2005

Data points for the U.S. white population can be found in Appendix D. Vermont data points can be found in Table A-1.

DEATHS

There were 5,044 resident deaths in 2005, 55 more than in 2004. The crude death rate increased to 8.1 per 1,000 population. The death rate has fluctuated between 8.1 and 8.5 since 1988; prior to then it had been slowly declining from 11.2 in 1960, to 10.0 in 1970, down to 9.0 in 1980. The Vermont crude death rate was slightly higher than the U.S. white crude death rate until 1970 when the rates converged and remained similar through 1980. Since 1981, Vermont's death rate has been slightly lower than the U.S. white rate. The U.S. white rate for 2005 was 8.7. Comparisons are made to the U.S. white rate because 99.5 percent of Vermont residents who died in 2005 were white (Table C-9).

For the past 40 years, the two leading causes of death in Vermont have been heart disease and cancer. Heart disease and cancer accounted for 48.2 percent of the deaths in 2005 (Table C-11). The heart disease crude death rate peaked in the 1960's at 439.5 deaths per 100,000 population, but has decreased significantly since then. The rate for 2005 was 198.4 per 100,000. In contrast to the dramatic declines in the rates for heart disease, the crude death rate for cancer (or malignant neoplasms) rose steadily through the 1980's and 1990's before starting to decline in this decade. After a high of 204.0 per 100,000 population in 2001, the rate decreased to 191.8 in 2005 (Table C-1).

Chronic lower respiratory diseases (formerly referred to as chronic obstructive pulmonary diseases), the fourth leading cause of death in Vermont since 1985, moved up to the third leading cause in 2005. The crude death rate for this cause has increased over the past twenty plus years from 33.0 in the period from 1979 to 1981 to 50.9 in 2000. Following a few years of declining rates earlier this decade, the rate sharply increased to 61.0 in 2005.

Accidents (or unintentional injuries) moved up to the fourth leading cause of death in Vermont, from a previous position of fifth, which it had maintained since 1999. The crude death rate for accidents peaked at 58.4 in the period from 1969 to 1971, and declined to 31.3 in 1994 to 1996. Since the mid 1990's however, the death rate from accidents has continued to increase. The crude rate for 2005 was 43.5.

Cerebrovascular diseases, or stroke, dropped from the third leading cause of death in 2004 to the fifth leading cause in 2005. The crude death rate for cerebrovascular diseases has dropped significantly from its' peak of 131.9 in the early 1960's to 41.7 in 2005.

The crude death rate from Alzheimer's disease steadily increased throughout the 1990's and into this decade, resulting in movement up from the tenth to the seventh leading cause of death in 1999. In 2004, Alzheimer's disease moved up to the sixth leading cause of death, and remained there in 2005 with a crude rate of 29.5.

Diabetes remained the seventh leading cause of death in Vermont in 2005. Though the rate has fluctuated in recent years; generally, Vermont has experienced an increasing trend in the crude death rate for diabetes over the past fifteen years. The rate increased from 22.0 in the period 1989 to 1991 to 26.9 in 2000 and 29.6 in 2003, before declining to 24.0 in 2004, and increasing to 27.6 in 2005.

Influenza and pneumonia moved up to the eighth leading cause in 2005, with a crude rate of 15.6 deaths per 100,000, an increase from 13.8 in 2004. Intentional self-harm (or suicide) dropped from the eighth to the ninth position in 2005 with a rate of 12.0, a decrease from 14.6 in 2004.

Parkinson's disease was the tenth leading cause of death in Vermont in 2005. With a crude rate of 9.1 deaths per 100,000 population, this is the first year that this disease appeared in the top ten.

The leading causes of death varied with age (Table C-2) and (Table C-14). Unintentional injuries were the leading cause of death for people age 15 to 44. Cancer was the leading cause of death, followed by heart disease for 45-84 year olds, and at ages 85 and higher, the causes were reversed with heart disease as the leading cause, followed by cancer.

Death rates dramatically increase after age 75. While people age 75 and over comprised only 6.6 percent of the total population, they accounted for 63 percent of total deaths. Except for accidents and influenza and pneumonia, the leading causes of death in this age group were all chronic diseases.

The leading causes of death varied by sex as well (Table C-1) and (Table C-11). The top three causes for males and females were the same: heart disease, cancer and chronic lower respiratory diseases.

Accidents, cerebrovascular diseases and diabetes ranked fourth, fifth, and sixth for males, while cerebrovascular diseases, Alzheimer's disease, and accidents were the fourth, fifth, and sixth leading causes of death for females.

Suicide and Alzheimer's disease were the seventh and eighth leading cause of death among males, while diabetes and influenza and pneumonia were ranked seventh and eighth for females.

Influenza and pneumonia, and Parkinson's disease were the ninth and tenth leading causes for males, and Parkinson's disease and suicide were ranked ninth and tenth among females.

Deaths occurring in a hospital accounted for 40.2 percent of Vermont resident deaths (Table C-21), down from 62 percent in 1980, 53 percent in 1990 and 41.2 percent in 2000. In 2005, 26 percent of Vermont resident deaths occurred at home, and 24.3 percent occurred in a nursing home.

Figure 10
FIVE LEADING CAUSES OF DEATH IN 2005,
FOR VERMONT AND U.S. WHITE POPULATION

Vermont death rates are age-adjusted to the 2005 U.S. white population. U.S. white rates are the 2005 crude death rates.

(1) CAUSE OF DEATH IS CODED BY THE INTERNATIONAL CLASSIFICATION OF DISEASES. DEATHS IN 1979 TO 1998 WERE CODED ACCORDING TO ICD-9. EFFECTIVE JANUARY 1, 1999 DEATHS WERE CODED ACCORDING TO ICD-10. SINCE SIGNIFICANT CHANGES WERE MADE IN ICD-10, THE CODE NUMBERS FOR ICD-9 AND ICD-10 ARE GIVEN IN ADDITION TO COMPARABILITY RATIOS WHICH HAVE BEEN APPLIED TO THE EARLIER RATES TO MAKE THEM COMPARABLE TO THE ICD-10 RATES.

Figure 11b
VERMONT AND U.S. WHITE
FETAL MORTALITY RATES
1955 - 2005

Data points for the U.S. white population can be found in Appendix D. The 2005 U.S. white rate is not available at this time. Vermont data points can be found in Table A-1.

INFANT DEATHS, FETAL DEATHS, ABORTIONS AND PREGNANCIES

INFANT DEATHS

In 2005, there were 42 resident infant deaths for a rate of 6.5 infant deaths per 1,000 live births. This is the highest rate since 1998 for Vermont ([Table A-1](#)). The rate is above the *Healthy Vermonters 2010* goal of 4.5, and is higher than the 2005 U.S. white rate of 5.7. Comparisons are made to the U.S. white rate because all of the Vermont resident infant deaths were to whites in 2005. The Vermont infant mortality rate steadily declined from 24.0 in 1960 to 5.88 per 1,000 live births in 1991. Since 1991 the rate has fluctuated between a high of 7.4 in 1994 and a low of 4.2 in 2002.

Twenty six (62.0 percent) of the infant deaths occurred during the neonatal period, that is before the infant became 28 days old ([Table D-6](#)). The neonatal death rate was 4.0 deaths per 1,000 live births ([Table D-5](#)), higher than the 2005 U.S. white neonatal death rate of 3.8. The Vermont neonatal death rate has decreased over the past four decades from 18.6 in 1960, to 14.4 in 1970, to 6.2 in 1980, to 3.6 in 1990 ([Table A-1](#)). The rate increased through the nineties to a high of 5.9 in 1998 before sharply dropping to 3.2 in 1999. After increasing to 3.8 in 2000, the rate has fluctuated over the past few years.

The leading causes of infant deaths ([Table D-9](#)) were respiratory disorders (6), maternal complications (4), and birth defects (4).

One of the most important risk factors in infant mortality is low birth weight ([Table D-7](#)). Of resident infants who died in 2005, 54.8 percent had a birth weight less than 2500 grams (5 pounds 8 ounces), while 6.2 percent of all resident births were low weight. The infant mortality rate for low weight births was 57.5 deaths per 1,000 live births. Age of mother is also related to infant mortality ([Table D-5](#)), with the highest rates typically seen in the youngest and the oldest age groups. From 2003 to 2005, the infant mortality rate for mothers 15 through 19 years of age was 7.6, and for mothers age 40 through 44 the rate was 8.1. The 35 to 39 year old maternal age group had the highest neonatal death rate at 5.1.

FETAL DEATHS

Unlike births and deaths, reports of fetal deaths and abortions are not shared among states. Therefore, statistics concerning these events reflect occurrences in Vermont only and do not include Vermont resident fetal deaths and abortions that occurred in other states.

There were 26 resident fetal deaths in 2005 ([Table D-1](#)) for a rate of 4.0 per 1,000 live births and fetal deaths, up from 3.3 per 1,000 live births and fetal deaths in 2004 ([Table D-5](#)). Of the fetal deaths in Vermont, 20 weighed less than 2500 grams ([Table D-7](#)). From 2003 to 2005, the fetal death rates were highest in the youngest and older age groups: 7.6 per 1,000 live births for women age 15 to 19, and 5.0 for women age 35 to 39 ([Table D-5](#)).

VERMONT ABORTIONS

There were 1620 abortions performed in Vermont in 2005, a decrease following three years of consecutive increases. Vermont residents accounted for 1448, or 89.4 percent. This represents a rate of 11.4 per 1,000 women age 15 to 44.

The abortion ratio is the number of resident abortions occurring in Vermont times 1,000, divided by the total

resident live births. The abortion ratio for 2005 was 223.6 abortions per 1,000 live births, a decrease from 227.4 in 2004, which was the highest ratio since 1998. The most recent U.S. white abortion ratio available was 161 per 1,000 live births, in 2004.

Women age 20 to 24 had the highest *age-specific* abortion rate, of 22.9 per 1,000 women, followed by women age 25 to 29 at 16.5. First trimester abortions accounted for 94.5 percent of all Vermont abortions and 69.1 percent of all Vermont abortions were for pregnancies of less than 9 weeks duration (Table E-5). See Appendix B for the method used to compute the number of weeks of gestation.

VERMONT RESIDENT PREGNANCIES

The pregnancy rate is derived by adding live births, fetal deaths and abortions. The pregnancy rates presented in this report underestimate the actual number of pregnancies for two reasons. First, Vermont resident abortions and fetal deaths that occur out of state are not reported to us. Second, by statute, fetal deaths prior to 20 weeks gestation are not reportable. Since residents of some counties may be more likely to use out-of-state services, the extent of these underestimates may differ among counties.

In 2005, the pregnancy rate in Vermont was 62.6 pregnancies per 1,000 women age 15 to 44 (Table F-1), a decrease from 63.8 in 2004 which was the highest rate since 1995. Overall, the pregnancy rate peaked at 127.6 in 1960, dropped steadily until 1995, and has remained fairly stable since then (Table A-1).

The 2005 teen pregnancy rate was 33.0 pregnancies per 1,000 women age 15 to 19 years (Table F-1). This is an insignificant decrease from 33.1 in 2004, but in general the teen pregnancy rate has been decreasing since 1991. In 2005, the highest pregnancy rate was seen in women 25 to 29 years of age at 116.0, followed by the 30 to 34 age group at 107.6. The lowest rate was for women age 35 to 44 at 27.2.

Figure 12
VERMONT AND U.S. WHITE ABORTION RATIOS
1975 - 2005

Data points for the U.S. white population can be found in Appendix D. Vermont data points can be found in Table A-1. U.S. White 2005 ratio is not available at this time. U.S. ratios are based on reporting states.

NOTES:

Fetal and perinatal death rates are the number of resident fetal deaths and perinatal deaths per 1,000 resident live births and fetal deaths.

Neonatal and infant death rates are the number of resident neonatal deaths and infant deaths per 1,000 resident live births.

Data for the years 2003-2005 have been combined to produce more stable rates.

(2) DIFFERENCE BETWEEN TOTAL AND 100% EQUALS PERCENT OF FETAL DEATHS.

Marriages and Divorces

Figure 13
VERMONT AND U.S. MARRIAGE AND DIVORCE RATES
1955 - 2005

Data points for the U.S. population can be found in Appendix D. Vermont data points can be found in Table A-1.

MARRIAGES & DIVORCES

MARRIAGES

In 2005, 5,532 marriages were performed in Vermont, 304 less than in 2004. The 2005 Vermont rate was 8.9 per 1,000 of population, the lowest rate in Vermont in more than 20 years, but higher than the 2005 U.S. provisional rate of 7.7. Marriages between two out-of-state residents accounted for 31.1 percent of the marriages in Vermont (Table G-2).

There was the usual seasonal variation with more marriages occurring in summer than in any other season. August (863) was the most popular month for marriages in 2005 (Table G-7).

Just over half (52.4 percent) of the marriages were firsts for both bride and groom (Table G-5). For the brides, 64.1 percent were first marriages, and for the grooms, 62.9 percent were first marriages. Remarriages for both bride and groom accounted for 25.2 percent of marriages in Vermont.

The percentage of civil ceremonies decreased to 59.9 percent in 2005 (Table G-8). This is the second decrease since 1990.

DIVORCES

There were 2,219 divorces granted in 2005; a decrease of 233 from 2004. This represents a rate of 3.6 per 1,000 residents, slightly lower than the 2005 U.S. provisional rate of 3.7.

The median length of marriages ending in divorce was 9 years 4 months, with a range of 2 months to 55 years 10 months. A little more than fifty-six percent of divorces followed a separation of a year or longer (Table H-3). The median age at the time of divorce was 39 for women with a range of 18 to 90 years. The median age at the time of divorce was 42 for men with a range of 18 to 90 years.

In 2005, 60 percent of divorces involved at least one child under the age of 18 (Table H-5), and a total of 1,058 children (Table H-7) were involved in a divorce. This represents an estimated 0.8 percent of all children residing in Vermont.

Civil Unions and Dissolutions

CIVIL UNIONS AND DISSOLUTIONS

CIVIL UNIONS

In 2005, 452 civil unions were established in Vermont, down from 712 in 2004. The highest number (60) occurred in July.

Civil unions involving out-of-state residents accounted for 72 percent of the total number of civil unions (Table I-2), down from 79 percent in 2004. The states with the largest number of residents who established civil unions were New York, New Hampshire and Florida (Table I-1). The largest number of Vermont residents who established civil unions resided in Chittenden County (Table I-2).

Seventy-three percent of the civil unions were between female partners, and the most common age group for male partners was 40 to 44, and for female partners it was 40 to 44 (Table I-4). Civil union partners tend to be highly educated: 50 percent completed at least four years of college (Table I-5).

Table I-6, shows the total number of civil unions or marriages, including the current civil union, that each person has been a party to during their lives. For 74 percent of the civil union partners, this was their first union, or marriage.

DISSOLUTIONS

The dissolution of civil unions follows the same procedures, same requirements, rights, and obligations as divorces. There were 34 dissolutions in 2005.

Southwestern Vermont Medical Center	Bennington	Bennington
Springfield Hospital	Windsor	Springfield
Vermont State Hospital	Washington	Waterbury
Veterans Administration Center	Windsor	White River

APPENDIX B

OBSTETRIC DATES AND INTERVALS AND WEIGHT GAIN RECOMMENDATIONS

MONTH PRENATAL CARE BEGAN

Since 1988, the Vermont Department of Health has used the National Center for Health Statistics method of calculating the month prenatal care began. This allows Vermont data to be more easily compared to national data, and eliminates any errors that could be introduced by hospitals using different reporting methods.

The calculation for month prenatal care began changed at the national level with the 2003 Revision of the U.S. Standard Certificate of Live Birth. Vermont implemented its' new birth certificate on July 1, 2005, based on the 2003 Revision of the U.S. Standard, so the Department of Health is using the new calculation starting in 2005. The new calculation converts to century dates the date of last menses and the date of the first prenatal visit, determines the difference in number of days between these dates, and then converts the days to months of pregnancy. For example, if the date of last menses was March 15, 2005 and the date of the first prenatal visit was June 30, 2005, then the difference is 107 days which means that prenatal care began in the fourth month.

Please note that this change in calculation affects the rate of entry into first trimester prenatal care. Analysis done by the Vermont Department of Health shows that this change in calculation reduces the rate of entry into first trimester prenatal care by about 7%, so the rate for 2005 should not be compared to rates for prior years.

GESTATIONAL AGE

Live Births and Fetal Deaths: The methodology used to determine gestational age matches that used by the National Center for Health Statistics.

Two measures of gestational age are available from the standard certificates. The standard certificates collect information on the first day of the mother's last menstrual period (LMP). The interval between the LMP and the date of birth is the *calculated* gestational age. The standard certificate also collects a *clinical estimate* of gestation.

The primary measure used by NCHS to determine the gestational age of the newborn is the *calculated* weeks of gestation. However this method is subject to error due to imperfect maternal recall and to misidentification of the LMP. Therefore an edit is run that checks whether the calculated weeks of gestation is consistent with the infant's plurality and birth weight. If the birth weight is within the bounds for the calculated weeks of gestation, then the *calculated* weeks of gestation becomes the assigned gestational age. If the birth weight is not within the bounds for the calculated weeks, but it is within the bounds for the clinical estimate of gestation, then the *clinical estimate* of gestation is assigned as the gestational age. If the birth weight does not fit within the bounds for either the calculated weeks of gestation or the clinical estimate of gestation, the gestational age is designated "unknown". If the month and year for LMP are given, but the day is missing, the gestational age is *imputed* using the gestational age of the preceding record that has complete data with the same computed month of gestation and the same 500-gram birth weight interval.

In 2005, 91.5 percent of the Vermont resident records used the *calculated* weeks, 8.3 percent used the *clinical estimate* of the weeks, and the remaining 8 records were designated "unknown" gestational ages.

Abortions: Gestational age is calculated from the date of last normal menses and date of abortion. The clinically estimated weeks is used if the date of last normal menses is unknown, or if the calculated weeks and the clinically estimated weeks are more than two weeks apart.

WEIGHT GAIN DURING PREGNANCY

The weight gain guidelines reflected in this report were taken from Nutrition During Pregnancy, Institute of Medicine, National Academy of Sciences, 1990. The recommendations are as follows:

PRE-PREGNANCY BMI	RECOMMENDED WEIGHT GAIN
< 19.8	28 - 40 lbs
19.8 - 26.0	25 - 35 lbs
26.1 - 29.0	15 - 25 lbs
> 29.0	15 - 25 lbs
Multiple births	35 - 45 lbs

APPENDIX C
