We gratefully acknowledge the contributions of the medical records staff, physicians and midwives, funeral directors, lawyers and court clerks for their help in collecting and providing us with this data.

We also recognize the 251 town and city clerks, who are our local registrars. Without them, these analyses of Vermont's vital statistics would not be possible.

THE VERMONT VITAL STATISTICS SYSTEM

Statewide vital registration began in Vermont in 1857, when the General Assembly passed a bill requiring that towns report to the Secretary of State all births, marriages, and deaths occurring in their jurisdiction. Prior to that time, some towns kept such records in order to resolve questions concerning the distribution and inheritance of property. Vital records, particularly death records, gradually became recognized as an important tool in studying the location and spread of epidemics. In 1896, the Legislature transferred responsibility for the vital statistics system to the newly formed Board of Health, the forerunner of the Vermont Department of Health. The Department of Health has retained this responsibility to the present day.

The Vermont vital statistics system monitors the following vital events: births, deaths, marriages, divorces and dissolutions, fetal deaths, and abortions. Each type of vital record follows a different path before being used to produce the statistics published here.

Births: When a birth occurs, the physician, midwife, or other birth attendant is required to complete a birth certificate and file it with the town clerk in the town of birth within 10 days. For hospital births, it is usually the medical records staff that enters the birth information into the Electronic Birth Registration System (EBRS) and prints the birth certificate. The birth certificate is recorded and filed in the town where the birth took place, and a certified copy is sent to the Department of Health.

Deaths: Although a physician is responsible for completing the death certificate, the job may be, and often is, delegated to the funeral director. Most of the information needed to complete the death certificate is obtained from the family of the deceased; however, the physician must complete and certify the cause of death information. Once a death record is completed in the Electronic Death Registration System (EDRS), it is registered and the death certificate is available to the town clerks for filing.

Marriages: When a couple wishes to marry in Vermont, they provide a town clerk with the information needed to complete the license. The couple takes the license to an officiant, who signs and dates it, and returns it to the town clerk. The town clerk records and files the certificate, and sends a certified copy to the Department of Health.

Divorces and dissolutions: A divorce certificate or certificate dissolving a civil union is initiated by a lawyer or other individual handling the divorce or dissolution. The certificate is filed with the court as part of the divorce or dissolution proceedings. The court keeps the certificate until the decree becomes final, usually three months after the court hearing. When the decree is final, the court clerk signs the certificate and sends it to the Department of Health for filing.

Fetal deaths and abortions: Reports of fetal death and induced termination of pregnancy (abortion) are sent directly to the Department of Health by the physician, hospital, or clinic that performs the procedure. By law, these reports are for statistical purposes only, are not public records, and are destroyed after five years.

The Department of Health also receives abstracts for Vermont resident births and deaths that occur in other states and in Canada. This allows the Department to do statistical analyses of vital events involving Vermont residents, including events which occurred outside of the state. All vital records received are data entered and stored electronically, and data from births and deaths which occur in Vermont is transmitted to the National Center for Health Statistics to become part of a national database.

EXPLANATORY NOTES

1. The tables in this bulletin were derived from records of vital events filed at the Vermont Department of Health for calendar year 2014.
2. Rates are based on the 2014 population estimates produced by the United States Census Bureau.
3. Caution must be used in comparing rates due to the small population in Vermont and the small number of events recorded.
4. In past reports rate comparisons were made to the U.S. white population rather than entire U.S. population because less than five percent of the Vermont population was non-white. However, starting with the 2011 report, comparisons are made to the total U.S. population.
5. If you have questions about the information found in this bulletin, you may contact a statistician at the Vermont Department of Health, 802-863-7300.
6. If you have questions about the population figures found in this bulletin, you may call the Vermont Department of Health to request a copy of The Population and Housing Estimates, which also provides information about age groups other than those presented in this publication.

DEFINITIONS, RATES, AND RATIOS

ABORTION: The purposeful interruption of an intrauterine pregnancy with the intention other than to produce a live-born infant or other than to remove a dead fetus, and which does not result in a live birth.

ABORTION RATE: Number of resident abortions occurring in Vermont x 1000, divided by the total resident women ages 15 to 44.

ABORTION RATIO: Number of resident abortions occurring in Vermont x 1000, divided by the total resident live births.

AGE ADJUSTMENT: Age adjusting allows one to compare rates among populations having different age distributions by adjusting the crude rates in each population to a standard population base. In this bulletin, county rates are adjusted using the state population distribution as the standard.

The computation formula is: The sum of (age-specific rate for each age group x standard population in that age group) multiplied by 1000, and then divided by the total standard population.

AGE-SPECIFIC DEATH RATE: Number of resident deaths in a specific age group x 1000, divided by the total resident population in a specific age group (using population estimates as of July 1).

AGE-SPECIFIC FERTILITY RATE: Number of resident live births to mothers in a specific age group x 1000, divided by the total resident female population in a specific age group (using population estimates as of July 1).

AGE-SPECIFIC PREGNANCY RATE: Number of resident pregnancies to women in a specific age group x 1000, divided by the total resident female population in a specific age group (using population estimates as of July 1).

ANNULMENT: The invalidation or voiding of a marriage, or civil union, which confers on the parties the status of never having been married to each other.

CIVIL UNION: A civil union is a legal relationship that provides for same-sex couples in Vermont all the benefits, protections, and responsibilities under law as are granted to spouses in a marriage.

CIVIL UNION RATE: Total number of civil unions x 1000, divided by the total resident population (using population estimates as of July 1).

CRUDE BIRTH RATE: Number of resident live births x 1000, divided by the total resident population (using population estimates as of July 1).

CRUDE DEATH RATE: Number of resident deaths x 1000, divided by the total resident population (using population estimates as of July 1).

CUMULATIVE ROW PERCENT: The total number of cases in the current column plus each previous column in each row, expressed as a percentage of all cases in that row.

DEATH: The permanent disappearance of any evidence of life at any time after live birth.

DIVORCE: The final legal dissolution of a marriage.

DIVORCE RATE: The sum of the number of divorces and annulments x 1000; divided by the total resident population, (using population estimates as of July 1).

DISSOLUTION: The final legal dissolution of a civil union.

FERTILITY RATE: Number of resident live births to women ages 15 to 44 x 1000, divided by the total resident female population ages 15 to 44 (using population estimates as of July 1).

FETAL DEATH: A reportable fetal death is a death prior to the complete expulsion or extraction from the mother of a product of conception, which has passed through at least the 20th week of gestation or weighs more than 400 grams; the death is indicated by the fact that, after such expulsion or extraction, the fetus does not breathe or show any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles. Heartbeats are to be distinguished from transient cardiac contractions; respirations are to be distinguished from fleeting respiratory efforts or gasps.

FETAL DEATH RATE: Number of resident fetal deaths x 1000, divided by the total resident live births and resident fetal deaths.

FETAL DEATH RATIO: Number of resident fetal deaths divided by total resident live births.

INFANT DEATH: Death occurring in the first year of life.

INFANT DEATH RATE: Number of resident infant deaths x 1000, divided by the total resident live births.

LIVE BIRTH: The complete expulsion or extraction from the mother of a product of conception, irrespective of the duration of pregnancy, which, after such expulsion or extraction, breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of the voluntary muscles whether or not the umbilical cord has been cut or the placenta is attached. Heartbeats are to be distinguished from transient cardiac contractions; respirations are to be distinguished from fleeting respiratory efforts or gasps.

LOW BIRTH WEIGHT: A baby weighing less than 2,500 grams (5 pounds, 8 ounces) at birth.

LOW BIRTH WEIGHT PERCENT: The number of live births weighing less than 2,500 grams divided by the total number of live births.

MARRIAGE: The legal union of persons of opposite sex.

MARRIAGE RATE: Number of marriages x 1000, divided by the total resident population (using population estimates as of July 1).

NATURAL INCREASE: Occurs when the number of births is greater than the number of deaths.

NEONATAL DEATH: Death of a live-born infant before the infant becomes 28 days old (up to and including 27 days, 23 hours, 59 minutes from the moment of birth).

NEONATAL DEATH RATE: Number of resident neonatal deaths x 1000, divided by the total resident live births.

OCCURRENCE: The place where the event actually occurred.

PERINATAL DEATH: A fetal death or a death occurring before the infant becomes seven days old (up to and including six days, 23 hours, 59 minutes from the moment of birth).

PERINATAL DEATH RATE: Number of resident perinatal deaths x 1000, divided by the total resident live births and resident fetal deaths.

PLURALITY: The number of siblings born as a result of this pregnancy.

PREGNANCY RATE: Number of resident pregnancies in women ages 15 to 44 x 1000, divided by the total resident female population ages 15 to 44.

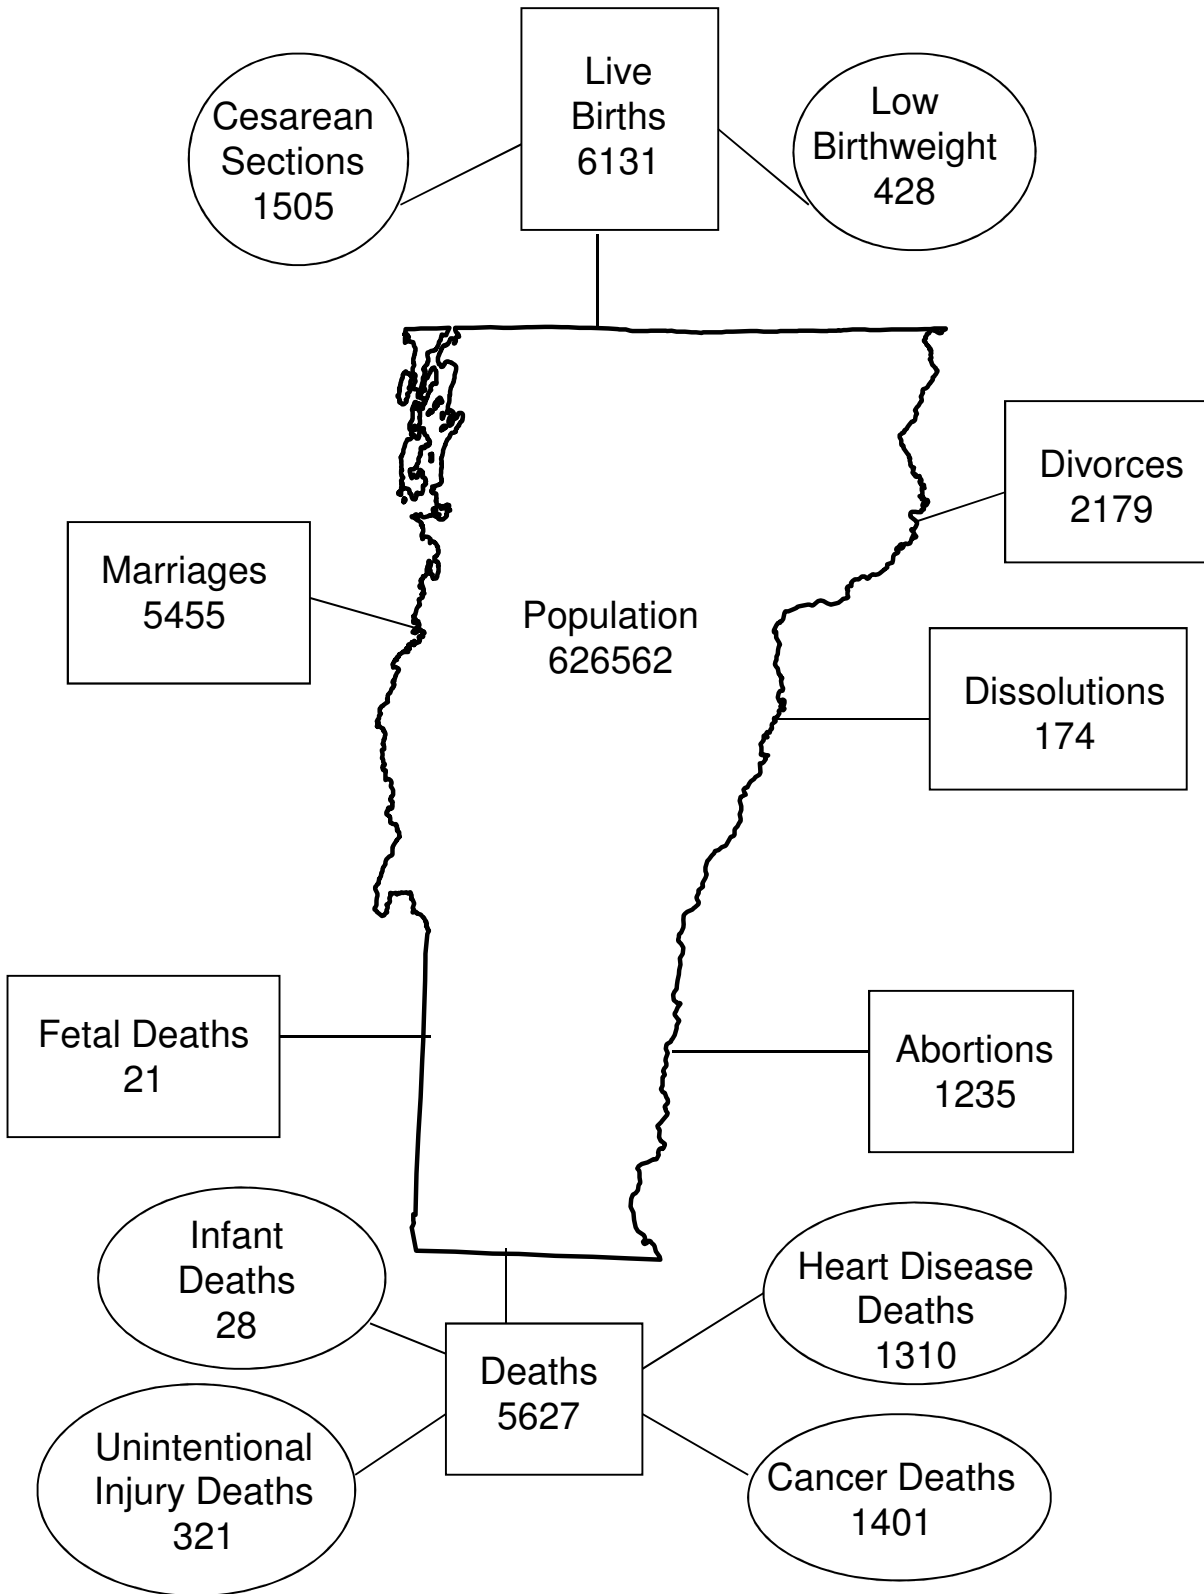

RESIDENCE: The usual place of residence for the person to whom the event occurred. For births and fetal deaths, residence is defined as the mother's usual place of residence.

ROW PERCENT: The number of cases in each row expressed as a percentage of all cases in that row.

WEEKS OF GESTATION: The number of weeks elapsed between the first day of the last menstrual period and the date of delivery.

Summary and Population

Vermont Vital Events for 2014

Marriages, divorces, dissolutions and abortions displayed above are occurrence data.
 All other events are resident data.

SUMMARY STATISTICS

Occurrence statistics include all events recorded in Vermont, including those involving visitors living outside Vermont. **Resident** statistics are limited to the events involving people with legal residence in Vermont, including events occurring outside Vermont. In 2014, reports of births and deaths to Vermonters were received from 25 states.

1. Resident data unless otherwise noted.
2. Population is the census population for those years when the census was taken and is the mid-year estimate for non-census years
NOTE: that mid-year population estimates are revised after each census is taken, so the 1991-1999 population figures and rates in this table differ from those presented in older publications.
3. Rate per 1000 population.
4. Rate per 1000 women ages 15-44.
5. Number of pregnancies includes Live Births and Fetal Deaths for 1857-1972, and Live Births, Fetal Deaths, and Abortions for 1973 – present.
6. Rate per 1000 Live Births.
7. Events per 1000 Live Births.
8. Data for these years is based on occurrence returns only.
9. 1857 population is the 1860 census population.
10. 1857 was the first year that town clerks were required to report vital events to the Secretary of State and returns for that year are incomplete.

BIRTHS

On July 1, 2005 Vermont implemented a revised birth certificate based on the 2003 revision of the U.S. Standard Certificate of Live Birth. Comparisons of Vermont rates to U.S. rates are made when possible, but for those items not comparable with the prior version of the birth certificate, comparisons will be made to rates for the 47 states and the District of Columbia, who also revised their birth certificates in 2014 or earlier. In those cases, references will be made to the “revised states”.

In 2014, 6131 babies were born to Vermont residents. This represents an increase of 159 births from 2013. The crude birth rate in 2014 is 9.8 per 1,000 Vermont residents, a slight increase from the 2013 rate of 9.5. The U.S. birth rate for 2014 was 12.5. The Vermont birth rate peaked in 1955 at 24 per 1,000 residents; it then dropped for two decades, remained relatively stable from the late 1970's through the 1980's, slowly and steadily decreased through the 1990's, and has continued a slow decline through this decade.

FERTILITY

Although the crude birth rate is based on the total population, a better measure of birth patterns is the fertility rate which is based on the population of women ages 15 through 44, the peak child-bearing years. The 2014 Vermont fertility rate was 52.9 per 1,000 women ages 15 through 44 (Table B-6), a slight increase from the 2013 rate of 51.5. The U.S. fertility rate was 62.9 in 2014. The fertility rate in Vermont peaked in 1960 at 126, declined through the 1960's and 1970's, leveled off slightly in the 1980's, steadily declined through the early 90's, and has remained fairly stable since 1995. Age-specific fertility rates have generally declined among the younger age groups (<30), and increased among the older age groups, with the largest increase among 35-44 year olds.

Just under half of all births (48.1 %) in 2014 were to women in their twenties (Table B-5), down slightly from 49.5 percent in 2010. Women age 30 and over accounted for 46.9 percent of births, up from 44.1 in 2010 and 43.9 percent in 2000. Women age 15 through 19 accounted for 5.0 percent of births, down from 6.4 in 2010 and 8.0 percent in 2000.

BIRTH WEIGHT

The median birth weight for all resident births in 2014 was 3,388 grams (approximately 7 pounds 8 ounces). Low birth weight infants are those born weighing less than 2,500 grams (5 pounds 8 ounces). They are much more likely than heavier babies to suffer short and long-term disabilities, and to die in infancy. In 2014, 7.0

percent of Vermont resident births were low birth weight (Table B-12) and 1.0 percent were very low birth weight (less than 1,500 grams or 3 pounds 5 ounces). The U.S. low birth weight rate for 2014 was 8.0 percent.

Low birth weight rates vary by age groups (Table B-12): in Vermont, the low birth weight rate among women under age 20 was 9.7 percent, compared to 6.8 percent of births among women age 20-29, 6.7 percent of births among women age 30-39, and 10.2 percent of births to women age 40 and older.

Infant birth weight is also positively associated with maternal weight gain: mothers who do not gain adequate weight during pregnancy are more likely to deliver low birth weight infants. On the other hand, there are risks associated with gaining too much weight including delivery complications, maternal and infant obesity. Although the weight gained by 19.2 percent of Vermont mothers in 2014 fell below the range recommended by the Institute of Medicine, 49.6 percent gained above the recommended range (Table B-23). Please refer to Appendix B for further information on the guidelines.

The single most important preventable risk factor for low birth weight is smoking during pregnancy. The low birth weight rate among women who smoked cigarettes during their pregnancy was 11.3 percent compared to 6.1 percent among women who did not smoke during pregnancy (Table B-19). The rate of women who reported smoking during pregnancy in 2014 was 16.7 percent, down from 18.2 percent in 2013. Among those who smoked before pregnancy or during the first trimester, 25.3 percent quit, up from the 2013 rate of 21.9, but still below the 2012 quit rate of 28.4 percent.

PRENATAL CARE

Early, comprehensive, and high quality prenatal care is essential for a healthy pregnancy and birth. Through prenatal care, pregnant women are screened for medical conditions and counseled on nutrition, behavioral risks (such as using tobacco and alcohol), and domestic violence.

In 2014, 84.4 percent of the babies were born to mothers who began prenatal care in the first three months of pregnancy (Table B-14), a small increase from 84.0 percent in 2013. In general, the percentage of women receiving first trimester prenatal care has steadily increased since 1987.

The proportion of births in 2014 to Vermont mothers who delayed care to the third trimester or received no prenatal care was 2.3 percent, down from 2.7 in 2013. As in previous years, the age of the mother is closely associated with the time of entry to prenatal care with young women seeking care later than older women (Table B-15).

Based on the APNCU Index, in 2014, 87.6 percent of Vermont resident mothers received at least adequate prenatal care, (Table B-25). The percent of Vermont mothers who received inadequate care was 7.6. Teen mothers had the highest percent of inadequate care (13.6 percent) while mothers 30 and older had the highest percent of adequate plus intensive care (90.2 percent).

MEDICAL RISK FACTORS

Of those births with medical risk factors reported for the mother, the most common were gestational hypertension, previous pre-term births, and gestational diabetes. The most commonly reported characteristics of labor and delivery were spinal anesthesia during labor, induction of labor, augmentation of labor and antibiotics received by mother during labor (Table B-21).

DELIVERIES

Of babies born in Vermont hospitals in 2014, 26.5 percent were delivered by cesarean section (Table B-18) compared to 32.2 percent for U.S. women in 2014. The primary cesarean section rate was 18.6 percent in Vermont for 2014, lower than the 22.3 percent for mothers in the revised states in 2014. Of mothers delivering in Vermont hospitals in 2014 who had a previous delivery by cesarean section, 20.3 percent had vaginal births, compared to 11.3 percent for mothers in the revised states in 2014.

VERMONT RESIDENT PREGNANCIES

The pregnancy rate is derived by adding live births, fetal deaths and abortions. The pregnancy rates presented in this report underestimate the actual number of pregnancies for two reasons. First, Vermont resident abortions and fetal deaths that occur out of state are not reported to us. Second, by statute, fetal deaths prior to 20 weeks gestation are not reportable. Since residents of some counties may be more likely to use out-of-state services, the extent of these underestimates may differ among counties.

In 2014, the pregnancy rate in Vermont was 62.8 pregnancies per 1,000 women ages 15 to 44 (Table B-31), an increase from 61.4 in 2013. Overall, the pregnancy rate peaked at 127.6 in 1960 then dropped steadily through the next four decades to a low of 58.7 in 2001 before moving back above 60 in 2002. The pregnancy rate has been fairly stable for the past decade (Table A-1).

The 2014 teen pregnancy rate was 21.7 pregnancies per 1,000 women age 15 to 19 years (Table B-31), a decrease from 22.2 in 2013. In general, the teen pregnancy rate has been decreasing since 1991. In 2014, the highest pregnancy rate was seen in women 25 to 29 years of age at 115.0 followed by the 30 to 34 age group at 110.5. The lowest rate was for teens.

Deaths

Figure 8
VERMONT AND U.S. CRUDE DEATH RATES
1980-2014

Vermont data points can be found in Table A-1. Data points for the U.S. can be found in Appendix D.

DEATHS

There were 5,627 resident deaths in 2014, 9 fewer than in 2013. The crude death rate remains at 9.0 per 1,000/population, the highest rate since 1980. The death rate has fluctuated between 8.0 and 9.0 since 1980; prior to then it had been slowly declining from 11.2 in 1960, to 10.0 in 1970, down to 9.0 in 1980. The Vermont crude death rate was slightly lower than the U.S. crude death from 1988 through 2005, and has been slightly higher than the U.S. crude death rate since 2007 (Figure 8).

From the 1960's through 2006 the two leading causes of death in Vermont were heart disease and cancer, respectively. In 2007 cancer took over as the leading cause of death among Vermonters. Cancer and heart disease accounted for 48.2 percent of the deaths in 2014 (Table C-11). The crude death rate for cancer (malignant neoplasms) increased steadily since 1980 before leveling off some in recent years. The 2014 rate of 223.6 is similar to the 2010 rate of 223.1.

In contrast, the heart disease crude death rate peaked in the 1960's at 439.5 deaths per 100,000/population, but has decreased significantly since then. The rate for 2014 was 209.1 per 100,000/population (Table C-1).

Chronic lower respiratory diseases (formerly referred to as chronic obstructive pulmonary diseases) have been the third leading cause of death among Vermont residents since 2005. The crude death rate for this cause increased from 33.0 per 100,000/population in the period from 1979 to 1981 to 50.9 in 2000. After declining in 2001 and 2002, the rate has fluctuated since. In 2014, the rate was 53.8 per 100,000/population, up slightly from 53.5 in 2010.

Accidents (or unintentional injuries) maintained its position as the fourth leading cause of death in Vermont, since 2005. The crude death declined to 31.3 in 1994 to 1996. From the mid 1990's through 2006, the death rate continued to increase, but has leveled off in recent years. The crude rate for 2014 was 51.2 deaths per 100,000/population, decreasing from the 2013 rate of 56.0.

The crude death rate from Alzheimer's disease steadily increased throughout the 1990's, resulting in movement up from the tenth to the seventh leading cause of death in 1999. In 2004, Alzheimer's disease moved up to the sixth leading cause of death, and remained there through 2010. In 2011 Alzheimer's moved up to the fifth leading cause of death in Vermont. The crude death rate for Alzheimer's disease in 2014 was 43.9 per 100,000/population.

Cerebrovascular diseases, or stroke, dropped from the third leading cause of death in 2004 to the fifth leading cause beginning in 2005. In 2011 cerebrovascular diseases dropped to the sixth leading cause of death in Vermont. The crude death rate for cerebrovascular diseases has dropped significantly from its peak of 131.9 per 100,000/population in the early 1960's to 42.8 in 2014.

Diabetes remained the seventh leading cause of death in Vermont in 2014, and the rate fluctuated throughout the last decade, from 26.9 per 100,000/population in 2000 to 29.6 in 2003, 27.4 in 2007 to 24.0 in 2010, up to 28.4 in 2012 and down to 26.3 in 2014.

Intentional self-harm (suicide) remained the eighth leading cause of death in 2014. The death rate increased steadily from 12.0 per 100,000/population in 2005 to 19.2 in 2011 before dropping to 13.7 in 2012. The suicide death rate increased to 19.8 in 2014.

The ninth leading cause of death in Vermont in 2014 was influenza and pneumonia with a crude death rate of 11.7 per 100,000/population. Chronic liver disease and cirrhosis was the 9th leading cause in 2013.

Chronic liver disease and cirrhosis was the tenth leading cause of death in Vermont in 2014, with a crude death rate of 10.9 per 100,000/population. Parkinson's disease had been the tenth leading cause of death in Vermont in 2012 and 2013.

The leading causes of death varied with age (Table C-2 and Table C-14). Unintentional injuries were the leading cause of death for people age 15 to 34. Cancer was the leading cause of death, followed by heart disease for 45-84 year olds, and at ages 85 and higher, the causes were reversed with heart disease as the leading cause, followed by cancer.

Death rates dramatically increase after age 75. While people age 75 and over comprised only 7.0 percent of the total population, they accounted for 60.9 percent of total deaths. Except for accidents and influenza and pneumonia, the leading causes of death in this age group were all chronic diseases.

The leading causes of death did vary by sex (Table C-1 and Table C-11). While cancer and heart disease were the top two causes for both Vermont males and females, later rankings for cause of death varied.

Accidents were the third leading cause for of death for Vermont males, while accidents were the sixth leading cause of death for females. Alzheimer's disease was the third leading cause of death for Vermont females, while this was the eighth leading cause for males. Men had higher death rates than women due to diabetes, suicide, influenza and pneumonia, and chronic liver disease, while women had higher death rates due to cerebrovascular disease and Alzheimer's disease.

Deaths occurring in a hospital accounted for 32.9 percent of 2014 Vermont resident deaths (Table C-17), slightly less than 35.8 percent in 2010, and down from 62 percent in 1980, 53 percent in 1990, and 42 percent in 2000. In 2014, 31.8 percent of Vermont resident deaths occurred at home and 27.2 percent occurred in a nursing home.

⁽¹⁾ CAUSE OF DEATH IS CODED BY THE INTERNATIONAL CLASSIFICATION OF DISEASES. DEATHS IN 1979 TO 1998 WERE CODED ACCORDING TO ICD-9. EFFECTIVE JANUARY 1, 1999 DEATHS WERE CODED ACCORDING TO ICD-10. SINCE SIGNIFICANT CHANGES WERE MADE IN ICD-10, THE CODE NUMBERS FOR ICD-9 AND ICD-10 ARE GIVEN IN ADDITION TO COMPARABILITY RATIOS WHICH HAVE BEEN APPLIED TO THE EARLIER (pre-1999) RATES TO MAKE THEM COMPARABLE TO THE ICD-10 RATES.

INFANT DEATHS, FETAL DEATHS, AND ABORTIONS

INFANT DEATHS

In 2014, there were 28 resident infant deaths, which equates to a rate of 4.6 infant deaths per 1,000 live births. This is a small increase from the rate in 2013 of 4.4 per 1,000 live births. This rate is lower than the 2014 U.S. rate of 5.8. The Vermont infant mortality rate steadily declined from 24.0 in 1960 to 5.8 per 1,000 live births in 1991. Over the past two decades the rate has fluctuated between a high of 7.4 in 1994 and a low of 4.2 in 2010. (Table A-1)

Twenty-one (75 percent) of the infant deaths occurred during the neonatal period, that is before the infant became 28 days old (Table D-3). The neonatal death rate was 3.4 deaths per 1,000 live births (Table D-2), below the 2014 U.S. neonatal death rate of 3.9. The Vermont neonatal death rate decreased from 18.6 in 1960, to 14.4 in 1970, to 6.2 in 1980, to 3.6 in 1990 (Table A-1), then followed an increasing trend through the nineties to a high of 5.9 in 1998. The rate has fluctuated throughout the past decade.

One of the most important risk factors in infant mortality is low birth weight (Table D-3). Of resident infants who died in 2014, more than two thirds (70.3%) had a birth weight less than 2500 grams (5 pounds 8 ounces), while 7.0 percent of all resident births were low birth weight. The infant mortality rate for low weight births was 44.4 deaths per 1,000 live births. Age of mother is also related to infant mortality (Table D-2), with the highest rates typically seen in the younger age groups. The infant mortality rate for mothers 15 through 19 years of age was 8.1 for 2012 through 2014.

FETAL DEATHS

Unlike births and deaths, reports of fetal deaths and abortions are not shared among states. Therefore, statistics concerning these events reflect occurrences in Vermont only and do not include Vermont resident fetal deaths and abortions that occurred in other states.

There were 21 resident fetal deaths in 2014 (Table D-1) for a rate of 3.4 per 1,000 live births and fetal deaths, down from 4.2 per 1,000 live births and fetal deaths in 2013 (Table D-2). Of the fetal deaths in Vermont, 14 weighed less than 2500 grams (Table D-3). From 2012 to 2014, the fetal death rate was highest in the 40 to 44 age group: 7.8 per 1,000 live births (Table D-2).

VERMONT ABORTIONS

There were 1235 abortions performed in Vermont in 2014, a slight increase from 1217 in 2013. Vermont residents accounted for 1150, or 93.1 percent. This represents a rate of 9.9 per 1,000 Vermont women age 15 to 44.

The abortion ratio is the number of resident abortions occurring in Vermont times 1,000, divided by the total resident live births. The abortion ratio for 2014 was 187.6 abortions per 1,000 live births, a decrease from the 192.6 seen in 2013. The U.S. abortion ratio was 200 per 1,000 live births in 2013. Women age 20 to 24 had the highest *age-specific* abortion rate, of 18.1 per 1,000 women, followed by women age 25 to 29 at 17.7.

First trimester abortions (less than or equal to 12 weeks) accounted for 90.8 percent of all Vermont abortions, and 72.1 percent of all Vermont abortions were for pregnancies of less than 9 weeks duration (Table E-5). See Appendix B for the method used to compute the number of weeks of gestation.

Fetal and perinatal death rates are the number of resident fetal deaths and perinatal deaths per 1,000 resident live births and fetal deaths.

Neonatal and infant death rates are the number of resident neonatal deaths and infant deaths per 1,000 resident live births.

Data for the years 2012-2014 have been combined to produce more stable rates.

Marriages and Divorces

Figure 12
VERMONT AND U.S. MARRIAGE AND DIVORCE RATES
1980 - 2014

Data points for the U.S. population can be found in Appendix D. Vermont data points can be found in Table A-1.

MARRIAGES & DIVORCES

MARRIAGES

NOTE: Marriage between same sex partners became legal in Vermont on September 1, 2009. The tables in this section include marriages between same sex partners and therefore the labels have been changed to reflect the labels used on the revised civil marriage license and certificate: Applicant A and Applicant B.

In 2014, 5,455 marriages were performed in Vermont, 323 fewer than in 2013. The 2014 Vermont marriage rate was 8.7 per 1,000 Vermont resident population, higher than the 2014 U.S. rate of 6.9. Marriages between two out-of-state residents accounted for 37.1 percent of the marriages in Vermont (Table F-2).

There was the usual seasonal variation with more marriages occurring in summer than in any other season. August (947) and September (771) were the most popular months for marriages in 2014 (Table F-5).

More than half (59.7 percent) of the marriages were firsts for both applicants (Table F-4). For Applicant B, 69.7 percent were first marriages, and for Applicant A, 69.5 percent were first marriages. Remarriages for both applicants accounted for 20.4 percent of marriages in Vermont.

Civil ceremonies accounted for 60.5 percent of marriages in 2014 (Table F-6).

DIVORCES

There were 2,179 divorces granted in 2014, a decrease of 65 from 2013. This represents a rate of 3.5 per 1,000 residents, higher than the 2014 U.S. rate of 3.2.

The median length of marriages ending in divorce was 9 years, with a range of 4 months to 52 years. The median age at the time of divorce was 42 for Applicant A with a range of 18 to 84 years. The median age at the time of divorce was also 42 for Applicant B, with a range of 19 to 82 years (Table G-2).

APPENDIX B

OBSTETRIC DATES AND INTERVALS AND WEIGHT GAIN RECOMMENDATIONS

MONTH PRENATAL CARE BEGAN

Since 1988, the Vermont Department of Health has used the National Center for Health Statistics method of calculating the month prenatal care began. This allows Vermont data to be more easily compared to national data, and eliminates any errors that could be introduced by hospitals using different reporting methods.

The calculation for month prenatal care began changed at the national level with the 2003 Revision of the U.S. Standard Certificate of Live Birth. Vermont implemented its' new birth certificate on July 1, 2005, based on the 2003 Revision of the U.S. Standard, so the Department of Health began using the new calculation in 2005. The new calculation converts to century dates the date of last menses and the date of the first prenatal visit, determines the difference in number of days between these dates, and then converts the days to months of pregnancy. For example, if the date of last menses was March 15, 2005 and the date of the first prenatal visit was June 30, 2005, then the difference is 107 days which means that prenatal care began in the fourth month.

Please note that this change in calculation affects the rate of entry into first trimester prenatal care. Analysis done by the Vermont Department of Health shows that this change in calculation reduces the rate of entry into first trimester prenatal care by about 7%, so rates for years 2005 and later should not be compared to rates for prior years.

GESTATIONAL AGE

Live Births and Fetal Deaths: The methodology used to determine gestational age matches that used by the National Center for Health Statistics.

Two measures of gestational age are available from the standard certificates. The standard certificates collect information on the first day of the mother's last menstrual period (LMP). The interval between the LMP and the date of birth is the *calculated* gestational age. The standard certificate also collects a *clinical estimate* of gestation.

The primary measure used by NCHS to determine the gestational age of the newborn was previously the *calculated* weeks of gestation, supplemented by an algorithm that determined if the calculated gestational age and birth weight were compatible, and the clinical estimate of gestational age may replace the calculated age in some cases. However this method is subject to error due to imperfect maternal recall and to misidentification of the LMP. Therefore, beginning in 2014 the clinical estimate of gestational age is assigned as the gestational age in all cases.

Abortions: Gestational age is calculated from the date of last normal menses and date of abortion. The clinically estimated weeks is used if the date of last normal menses is unknown, or if the calculated weeks and the clinically estimated weeks are more than two weeks apart.

WEIGHT GAIN DURING PREGNANCY

The weight gain guidelines reflected in this report were taken from “Weight Gain During Pregnancy: Reexamining the Guidelines” Institute of Medicine, National Academies Press, 2009. The recommendations are as follows for singleton, full term births:

PRE-PREGNANCY BMI	RECOMMENDED WEIGHT GAIN
< 18.5	28 - 40 lbs
18.5 - 24.9	25 - 35 lbs
25.0 - 29.9	15 - 25 lbs
\geq 30.0	11 - 20 lbs
