

[Healthcare-associated Infections \(HAI\)](#) are infections that people can get while receiving services at a healthcare facility. Hospitals can reduce the risk of HAIs by taking steps developed by the [Centers for Disease Control and Prevention](#) and the [Institute for Healthcare Improvement](#).

[Standardized Infection Ratio \(SIR\)](#) is a statistic used in these reports to track healthcare-associated infection prevention progress over time. The SIR is adjusted to account for factors that might cause infection rates to be higher or lower, such as hospital size, the type of patients a hospital serves, surgery types and patient characteristics.

Known Healthcare-associated Infections:

[Central Line-Associated Bloodstream Infection \(CLABSI\)](#) - a serious infection that occurs when germs (usually bacteria or viruses) enter the bloodstream through the central line. CLABSIs result in thousands of deaths each year and billions of dollars in added costs to the U.S. healthcare system, yet these infections are preventable.

[Clostridioides difficile \(C. Diff\)](#) - a bacterium that causes diarrhea and colitis (an inflammation of the colon). C. Diff causes almost half a million illnesses in the United States each year.

[Surgical Site Infections \(SSI\)](#) - an infection that occurs after surgery in the part of the body where the surgery took place. It can be a superficial infection or more serious and can involve tissues under the skin, organs, or implanted material.

NOTE

Due to the pandemic, hospitals were exempted from or given extension for data submission to various federal agencies. Because of this, the data below may not reflect the accurate number of infections reported, which will also affect how SIR was calculated.

Reporting Period for CLABSI, CAUTI, SSI: colon surgery, SSI: hysterectomy, MRSA, and C. diff are 10/1/22 - 9/30/23.

Reporting Period for SSI: Knees and SSI: Hips surgery are 10/1/2021-9/30/2022.
