Acknowledgments

The production of this document would not be possible without the assistance of many individuals and the cooperation of the hospitals.

The Vermont Department of Banking, Insurance, Securities and Health Care Administration (BISHCA) thanks the Vermont Association of Hospitals and Health Systems - Network Services Organization (VAHHS-NSO) for providing assistance under a contract with the department and for working with the hospitals to ensure timely and accurate reporting of the data. BISHCA also thanks the participating hospitals for their efforts in submitting the data and responding to requests for clarification and corrections. In addition, BISHCA appreciates the sharing of data by the New Hampshire Department of Health and Human Services, the Massachusetts Division of Health Care Finance and Policy and the New York Department of Health. These organizations provide data for Vermont residents using New Hampshire, Massachusetts and New York hospitals.

Disclaimer

Hospital discharge data for use in this publication were supplied by the VAHHS-NSO reporting system, Vermont Explor, under a contract with BISHCA. These data were supplied upon the authorization of the hospitals through agreements between VAHHS-NSO and each participating hospital.

After receipt of the data files from VAHHS-NSO, the data undergo additional editing and processing by the Vermont

Department of Health (VDH), under an agreement with BISHCA, before inclusion in the Vermont Uniform Hospital Discharge Data Set. The Vermont Uniform Hospital Discharge Data Set is used to construct this Hospital Utilization Report and is the official state data file available to the public. The Health Department does not assume responsibility for errors in the data due to coding or processing by hospitals, VAHHS-NSO Vermont Explor, or other data providers.

Introduction

The Vermont Inpatient Hospital Utilization Report provides information about patient health issues and hospital services provided within the inpatient setting.

Under the provisions of Act 53 addressing hospital and health system accountability and spending, these data provide key information about population-based utilization of inpatient services for the hospital community needs assessments (CNA) and the four-year health resource allocation plan (HRAP). The HRAP identifies and prioritizes statewide and sub-state need for health services and resources and informs the certificate of need (CON) process.

Data are presented in two basic ways:

- Hospital-based analyses compare data by hospital and include all patients who received services from that hospital, regardless of their residency. Hospital-based analyses have applications for health system planning, cost containment, and resource development.
- For inpatient data, hospital service area (HSA) analyses are used to compare data for residents of 13 geographic regions of Vermont who were provided services in any Vermont, New Hampshire, New York, or Massachusetts hospital. With some caveats, HSA analyses can help compare morbidity and practice variations across different regions of Vermont. See page 7 for maps of Vermont towns and HSAs.

This volume includes data across inpatient setting for all patients, regardless of residency, at Vermont's acute care hospitals. It also includes data for Vermont residents using New Hampshire, New York and and Massachusetts acute care hospitals.

History of the Hospital Utilization Report

The nine sections that comprise this volume are a continuation of a series of hospital utilization publications that have been issued annually since 1975. Although publication has been continuous, different organizations have been involved in its production over the years. The Cooperative Health Information Center of Vermont, Inc. (CHICV) published the Monographs from 1975 to 1982. In 1983, the CHICV corporation was dissolved and statutory authority to collect, process, store and analyze hospital utilization information was given to the Vermont Hospital Data Council. The Council designated the Vermont Department of Health (VDH) as manager of the hospital utilization data. In 1992, the Data Council's statutory authority was transferred to the Vermont Health Care Authority. In 1996, the Authority was merged with the Department of Banking, Insurance and Securities and became the Division of Health Care Administration. Under 18 V.S.A. §§ 9410, 9453, and 9457, the Division is charged with collecting hospital utilization data in a standardized format and to ensure that these data are not used to directly or indirectly identify individual patients or health care practitioners. The Vermont Department of Banking, Insurance, Securities and Division of Health Care Administration (BISHCA) have an agreement with VDH to manage the hospital discharge database and produce the utilization reports. The utilization reports have been published by VDH since 1983.

Beginning in 1998, a section on outpatient procedures (ambulatory surgeries) was included. Emergency Department (ED) and Hospital Setting Comparison sections were added in 2001. Prior to 1998, outpatient procedures were reported in a separate publication.

Beginning in 2006 the hospital utilization reports are published in four separate volumes, Inpatient Discharges, Outpatient Discharges, Emergency Visits and Comparison Across Hospital Setting. This report is the second in the series now titled the “Vermont Inpatient Hospital Utilization Report”.

Sources of Data

All fourteen of Vermont's civilian acute care hospitals have contributed data to the Vermont Uniform Hospital Discharge Data Set. The Veterans Administration hospital in White River Junction submitted data until June 30, 2006. The Brattleboro Retreat in Brattleboro and the Vermont State Hospital in Waterbury are strictly psychiatric hospitals and have not participated in this data collection effort. The acute care hospitals, under an agreement with the Vermont Association of Hospitals and Health Systems - Network Services Organization (VAHHS-NSO), supply discharge abstracts to the Missouri Hospital Association's Hospital Industry Data Institute, the VAHHS-NSO contractor. Under a contract with BISHCA, VAHHS-NSO provides data to VDH. Under agreements administered by BISHCA, VDH obtains records of Vermont resident discharges from hospitals in neighboring states from the Massachusetts Division of Health Care Finance and Policy, the New Hampshire Department of Health and Human Services and the New York Department of Health.

Upon receipt of Vermont hospital discharge data from VAHHS-NSO, VDH edits the data and checks for completeness and internal consistency. Results of these analyses are shared with VAHHS and participating Vermont hospitals as part of an ongoing quality improvement process.

Diagnosis and Procedure Grouping Systems

DRGs and MDCs

For inpatient discharges, Diagnosis Related Groups (DRGs) and Major Diagnostic Categories (MDCs) are used for grouping

diagnoses.

In October 1983, the U.S. Centers for Medicare and Medicaid (CMS) adopted a prospective system for reimbursing hospitals for hospitalizations of Medicare beneficiaries. This system established a payment schedule for groups of similar conditions that were expected to consume similar resources. Since 1983, the DRGs have been refined and added to a number of times, and are currently revised annually on October 1. The DRG assigned to an individual hospitalization is the definition in effect on the date of discharge. Beginning Oct 1, 2007 a major change in DRGs went into effect, these new DRGs are known as Medicare Severity Diagnosis Related Groups or MS-DRGs.

DRGs and MS-DRGs, which describe conditions and procedures related to similar body systems or etiologies, are grouped into 25 MDCs. MDCs are the basic tabulation units used in the inpatient report. Inpatient discharges with an invalid MDC, are excluded from this report. MDCs are listed in Appendix B. Appendix C lists DRGs and MS-DRGs within each MDC.

Exclusions

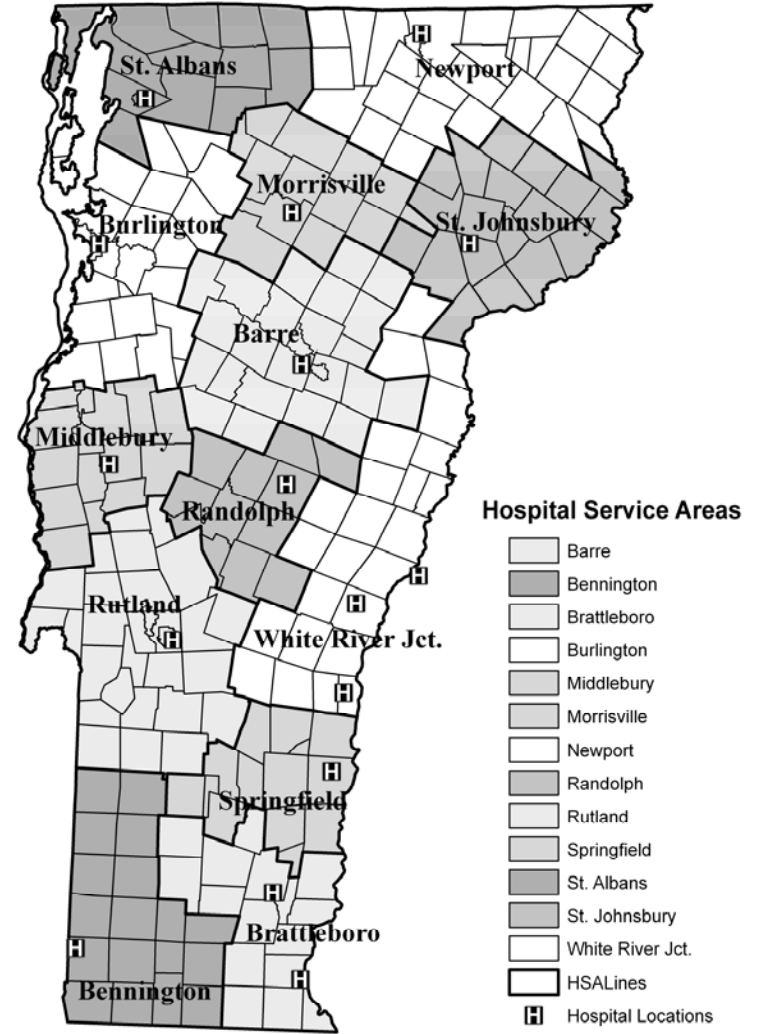

As in any dataset of this size, there are a small number of records with incomplete or missing elements. These records must be excluded from particular analyses. We have indicated the number of missing records in each table so that all totals can be reconciled. Veteran Administration data was not provided after June 30, 2006 so there is no VA included in the 2007 data. In 2005, 2.5% of the inpatient discharges were from the VA hospital, approximately half from out of state residents. Most VA resident discharges in 2005 came from the WRJ HSA and to a lesser degree Springfield and Randolph.

Throughout the report, to avoid counting hospitalizations for delivery twice, the maternal record is included, but the infant record is not. This is a standard practice in hospital utilization analysis. However, discharge records for infants are retained in the Vermont Uniform Hospital Discharge Data Set to support research and analyses that include this population.

Overview

- **Total health care spending** on Vermont residents increased 4.5 percent from 2006 to 2007 to \$4.2 billion while total spending on Vermont providers was approximately the same amount and increased 6.9 percent during the same period according to the [2007 Vermont Health Care Expenditure Analysis](#)¹. In 2007, hospital spending on Vermont residents totaled \$1.4 billion and accounted for 33.9 percent of total health care spending as the largest provider category followed by physician services at 14.7 percent of total health spending.
- **Vermont's Population is Aging:** From 1990-2007, the percent of Vermonters aged 45+ continued to grow. The percent of Vermonters 45 years or older in 2007 was 43.6% (Section I). According to the [U.S. Census in 2007](#)², the national rate for those 45 years or older was 39.8 percent. As the Vermont population continues to age, the number of adults with age-related medical conditions and chronic diseases will continue to rise and require more health care services. Medicare continues to be the leading principal payer for hospital inpatient discharges at 47.5 percent of total discharges (Section VII).
- **Total hospital revenues continued to rise**, but outpatient revenues continued to significantly outpace inpatient revenues (See Figure 1). Between 1998 and 2007, inpatient revenues increased 79.7% and outpatient revenues increased 241.8%. Per the *2007 Comparison Report*, the average charge for an inpatient hospitalization in Vermont was \$16,572 compared to \$15,456 in 2006, a change of 6.7%.

Inpatient Highlights

Highlights of Vermont Inpatient Utilization

- **In 2007 there were 52,057 inpatient discharges for Vermont residents** for hospitals in Vermont, New Hampshire, Massachusetts, and New York excluding newborns but including maternal records. Unlike prior years, there were no inpatient discharge records from the VA hospital in White River Junction included in the annual data set (Section V).
- **There were 48,074 inpatient discharges from Vermont hospitals in 2007**, excluding newborns but including maternal records, representing both Vermont residents and non-residents. Similar to the findings in 2006, almost half of these records, or 23,825 of the total inpatient discharges, originated in the Emergency Department (Section IX).
- **Inpatient utilization continues to decline.** The inpatient hospital discharge rate and average length of stay decreased significantly between 1990 and 2007 (See Figures 2 & 3). Factors influencing this decline include the continuing shift of treatment and procedures from the inpatient to the outpatient setting and changes in reimbursement and cost-containment strategies. The loss of the VA data in 2006 may account for the decline from 2005 to 2007.
- **In 2007, the Burlington hospital service area (HSA) had the lowest age-adjusted utilization rate at 73.4 discharges per 1,000 Vermonters and the Bennington hospital service areas had the highest rate at 106.8.** The average rate across all Vermont HSAs was 83.8. (Variation in utilization rates among hospital service areas from 2003-2007 is illustrated in Figure 5).
- **Out-migration of Vermont resident inpatient discharges continues to outpace in-migration of non-resident discharges.** Out-migration of Vermont resident discharges to hospitals in New Hampshire, New York and Massachusetts totaled 10,665 in 2007. 7,193 of the Vermont resident discharges were from Dartmouth Hitchcock Medical Center in NH. In-migration of non-resident discharges into Vermont hospitals totaled 6,682 (Section III).

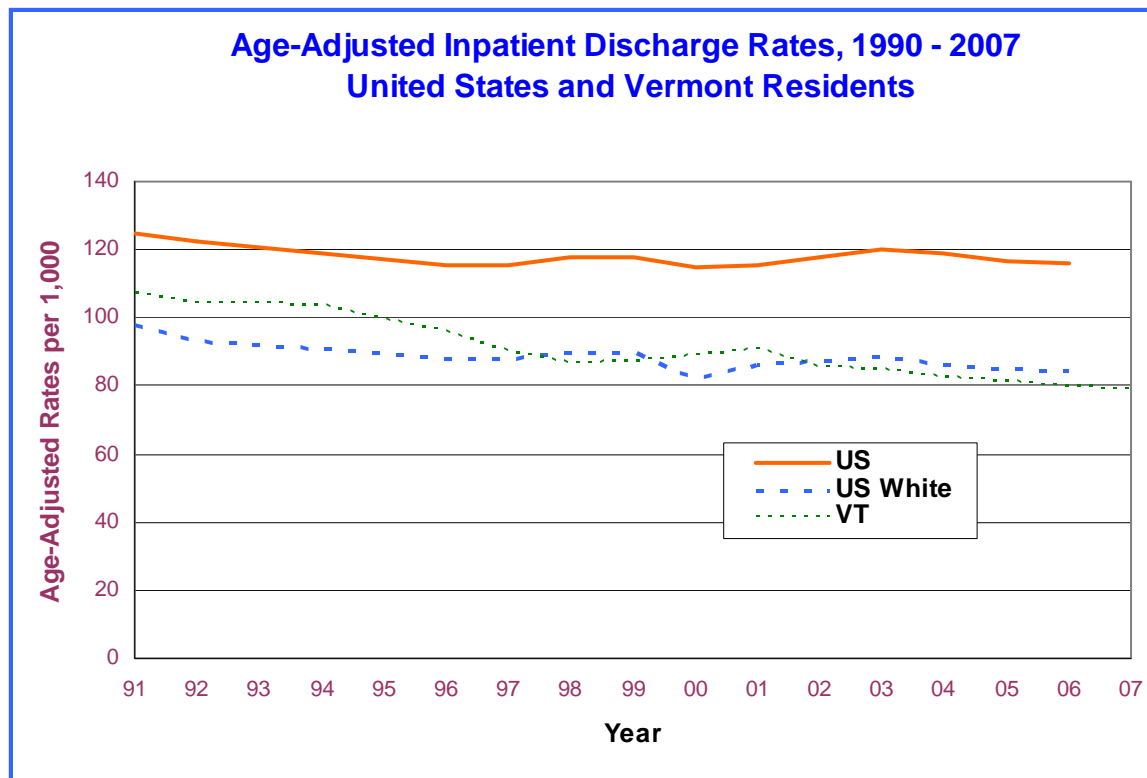

For more information on in-migration and out-migration for inpatient hospital services, see the “**Vermont Hospital Migration Reports**” at: <http://www.bishca.state.vt.us/HcaDiv/hcdefault.htm> under “**Data and Reports**”.

For information on utilization of outpatient hospital services, see the “**Vermont Hospital Utilization Report - Outpatient**” at: <http://www.bishca.state.vt.us/HcaDiv/hcdefault.htm> under “**Data and Reports**”.

Trends in Utilization: Discharge Rates

The age-adjusted discharge rate measures how often hospital care is provided on a population basis adjusting for differences in age.

- **The age-adjusted Vermont inpatient discharge rate continues to decline.** Vermont's inpatient hospitalization rate decreased significantly (-27.6 %) from 1990-2007. In 2007, the Vermont age-adjusted rate reached a new low of 78.9 per 1,000. The downward trend is due in part to the shift of treatment and procedures to the outpatient setting. The loss of the VA data in 2006 may account for the decline from 2005 to 2007.
- **The Vermont inpatient discharge rates are lower than overall U.S. rates.** Vermont's discharge rate was significantly lower than the overall U.S. rate every year from 1990-2007, and slightly lower than the U.S. "white" rate from 2002-2006. Since Vermont's population is less racially diverse than the overall national profile, the U.S. "white" rates are more comparable (national figures for 2007 are not available at this time).

Trends in Utilization: Average Length of Stay

The age-adjusted average length of stay is an approximate measure of the resources used per discharge, adjusting for differences in age.

- **Vermont’s age-adjusted average length of stay continues to decline.** Vermont’s average length of stay dropped significantly (-31.2%) from 1990-2007, due in part to the shift from inpatient to outpatient and community-based settings for health care services and changes in reimbursement and cost containment strategies. Similar drops occurred for the overall U.S. Rate (-26.8%) and the U.S. “White” rate (-26.9%) from 1990-2006 (national figures for 2007 are not available at this time).

Inpatient Hospital Utilization: Hospital Service Area

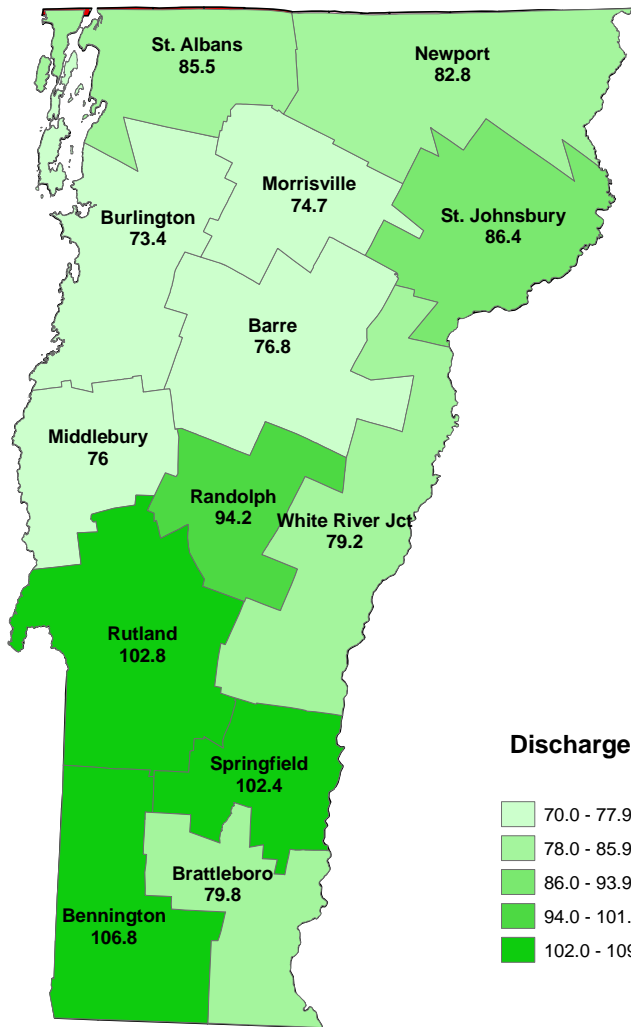

- **Utilization decreased between 2000 and 2007.** The number of discharges per 1000 residents between 2000 and 2007 decreased in every Hospital Service Area (HSA).
- **In 2007, the Bennington HSA had the highest age-adjusted discharge rate of 106.8 per 1000** and has maintained a continual upward trend since 2004. The Burlington HSA had the lowest rate of 73.4 and has maintained a continual downward trend during the same time period.
- **While the largest decrease of 12.8 discharges per 1000 occurred in the Springfield HSA,** this HSA continues to have a comparatively high inpatient discharge rate along with the Bennington and Rutland HSAs.

Reason for Hospitalization: Top Five MDCs for Discharges

MDCs (Major Diagnostic Categories) are 25 categories of related diagnoses that collapse over 700 detailed groupings called Medicare Severity Diagnosis Related Groups (MS-DRGs).

- **The top five MDCs** account for more than 63% of all hospitalizations.
- **Among these five MDCs, the most dramatic change since 1990** is the continued increase of Respiratory hospitalizations.
- **Among these five MDCs, the most significant trend since 2000** was the continual decline in Heart & Circulatory (with a slight rise in 2006) through 2007.
- **Pregnancy and Childbirth** declined until 2000, but has steadily increased through 2007.
- **Musculoskeletal** had a similar trend to Pregnancy and Childbirth with a decline until 2000 and increasing through 2007.

User's Guide to Inpatient Tables

Inpatient Data Collection in Vermont

Inpatient discharge data have been the core of the Vermont hospital utilization reports since 1975. These data have been helpful in hospital planning and have provided a longitudinal view of hospital utilization and the health of Vermonters.

Units of Measure

The inpatient sections use three measures of hospital utilization:

A *discharge* is an individual inpatient hospitalization. Discharge dates, not admission dates, are used to indicate when a case is reported. A count of discharges measures how often care is sought. The same individual will be counted as more than one discharge if hospitalized more than once during the time studied.

A *patient day* is defined as a stay in a hospital for all or part of a day. Patient days are one way of measuring the amount of care provided.

The *average length of stay* is the total patient days divided by the number of discharges in a selected category. It is a rough measure of the amount of care provided during a typical hospital stay.

Hospital Service Area Analyses

The majority of the nine inpatient Sections compare data or residents of hospital service areas (HSAs). Each HSA is defined by the geographically distinct population of Vermonters who are highly dependent on a hospital or group of hospitals. Each inpatient record is assigned to an HSA. This permits comparison of hospital utilization

patterns for residents of the various HSAs, regardless of where they are hospitalized.

Statistics for HSA analyses include population-based rates that are adjusted for differences such as age distribution in population characteristics from one HSA to another. Using population-based rates, especially age-adjusted rates, differences in hospitalization patterns for residents of different regions of the state can be identified. See pages 17-19 for two detailed examples.

HSAs are less relevant for certain services that have historically been regionalized such as acute inpatient mental health services for persons with severe mental illness. In 2007, four out of the fourteen Vermont community hospitals had dedicated inpatient psychiatric units in addition to Retreat Healthcare and the Vermont State Hospital.

Hospitals take interest in HSAs because residents of their HSAs are usually their principal Vermont consumers. Analysis of anomalies and trends within its service area can aid a hospital in identifying practice variations and in strategic planning. Finally, the size and shape of an HSA can be indicative of a hospital's market penetration and the environment in which it operates.

Vermont hospitals near Vermont's borders may provide care to people in neighboring, non-Vermont towns. However, out-of-state residents are excluded from the population-based HSA comparisons. In order to include out-of-state residents in a hospital service area, information would need to be collected on all hospitalizations of the residents in those areas, including use of non-Vermont hospitals. In contrast to the HSA comparisons, out-of-state residents using Vermont hospitals are included in the hospital-based comparisons.

While hospitals may provide the majority of care within their service area, a substantial quantity of the care received by the population may also come from other hospitals. If the hospital is a regional referral center, the hospital may be providing the majority of care to residents within its service area while also providing specialty care to residents from other service areas.

Fourth Version of Hospital Service Areas

Due to changes in technology, financing and reimbursement, population characteristics, and the economy, the health care system serving Vermonters constantly changes. The hospital service area (HSA) definitions used in the Reports have been modified three times to reflect changing discharge patterns.

Starting with the 2002 Report, HSAs are based on inpatient discharges, where the diagnosis indicated the need for immediate care, for the years 1997-2001. Prior definitions of HSAs have been based on all inpatient stays (except for newborns) and have used a strict decision rule for inclusion of ZipTowns which are towns or groups of towns (see definition below for ZipTowns) in a hospital's service area. Use of a strict inclusion rule meant that there were always towns that were not assigned to any HSA and were labeled "contested."

In preparing for this fourth version of HSAs, rules used to define the 3rd version of HSAs were applied to 1997-2001 data. The number of contested towns rose from 54 to 80, nearly a third of all Vermont towns. This resulted in the loss of one hospital service area and a serious erosion of others. As a result of this increase in contested towns, two major changes were made to the process of defining HSAs. In addition to these definitional changes, HSA names were changed. To distinguish these new HSAs from previous ones, HSAs were given the name of the most populous town in their area.

The first major change was that selection of records was limited to those discharges with diagnoses considered to require immediate

hospitalization as described by Newton and Goldacre in their 1994 article, "How many patients are admitted in districts other than their own, and why?" (Journal of Public Health Medicine, 1994, Vol. 16, No. 2, pp. 159-164). Newton and Goldacre used records of patients with acute conditions that require immediate hospitalization, because patients with these conditions tend to go to the hospital nearest to them when they become ill. The authors excluded newborns and patients transferred from another hospital. The authors included records with the following acute conditions as their primary diagnoses:

appendicitis (ICD-9-CM codes 530-543),
abscess of anal and rectal regions (ICD-9-CM codes 566),
peritonitis (ICD-9-CM codes 567),
acute myocardial infarction (ICD-9-CM codes 410),
pneumococcal pneumonia (ICD-9-CM codes 481), and
asthma (ICD-9-CM codes 493).

The second major change was the shift to a plurality rule in assigning ZipTowns to HSAs, so that all towns are assigned to an HSA with none remaining contested. ZipTowns are towns or groups of towns with over 1,000 residents and relatively contained ZIP code boundaries (see Appendix E for a list of ZipTowns in each HSA). ZipTowns were assigned to hospital service areas as follows:

- 1) If the plurality of a ZipTown's discharges were from a Vermont hospital or Dartmouth Hitchcock Medical Center (DHMC) in Lebanon, New Hampshire, the ZipTown was assigned to that hospital's service area.
- 2) If the plurality of a ZipTown's discharges were from a non-Vermont hospital other than DHMC, the ZipTown was assigned to the HSA of the Vermont hospital (or DHMC) with the next highest number of discharges.

One ZipTown called Guildhall, made up of five towns in Essex County which were previously designated as contested, had only four discharges to a nearby Vermont hospital. All four discharges were

Lunenburg residents discharged from Northeastern Vermont Regional Hospital in St. Johnsbury. Using the plurality rule, Lunenburg was added to the Burke area ZipTown which is assigned to the St. Johnsbury HSA. The remaining four towns in the Guildhall ZipTown had no discharges to a nearby Vermont hospital. These four towns were assigned to HSAs based on a decision to follow the boundaries used for the Health Department’s Community Public Health District Offices. Using this approach, Guildhall and Maidstone were also assigned to the Burke area ZipTown in the St. Johnsbury HSA. The remaining towns of Bloomfield and Brunswick were assigned to the Canaan area ZipTown in the Newport HSA.

The HSAs continue to include two multi-hospital areas: the White River Junction HSA (Dartmouth Hitchcock Medical Center, Mt. Ascutney Hospital, and the Veterans Administration Hospital) and the Brattleboro HSA (Brattleboro Memorial Hospital and Grace Cottage Hospital). These HSAs include multiple hospitals because resident hospitalizations are split among the hospitals with no clear majority of inpatient discharges concentrated at any one hospital.

Color maps of HSAs and a complete description of the process used to define the current service areas are found in the *2002 Vermont Hospital Monograph Companion*. Black and white maps of Vermont towns and HSAs are also shown on page 7 of the Introduction to this report.

Hospital Service Area Analyses Using Population-Based Rates

The rates reported in this volume combine information about hospitalizations and information about populations “at risk” of being hospitalized. Rates enable the comparison of areas that differ in population and HSAs are the population areas used in these comparisons.

Simple or “crude” rates are typically expressed as the number of events per some large number of people, such as 1,000. This rate is

called *crude* because it only compensates for relative population size. *Adjusted* rates incorporate additional variables, such as age, into the calculation.

For example, the “crude” discharge rate for residents of an HSA would be calculated by multiplying 1,000 times the following:

$$\frac{\text{hospitalizations of HSA residents in any VT, MA, NH, or NY hospital}}{\text{population of the HSA}}$$

To compare hospitalizations for Heart and Circulatory Diseases (MDC 5) in two HSAs, Burlington and Rutland, the number of hospitalizations (the numerator for the rate) would need to be established:¹

Discharges for Heart and Circulatory Diseases, 2007

Burlington HSA	1,662
Rutland HSA	1,083

Although more residents of the Burlington HSA are hospitalized for these conditions, it is not possible to answer the question of whether heart and circulatory diseases are a more significant problem for residents of the Burlington HSA. In order to answer this question, the number of people living in these two HSAs (the denominator for the rate) is needed.²

Population Estimates, 2007

Burlington HSA	171,012
Rutland HSA	64,079

¹Number of discharges by HSA and MDC are found in Sections V & VI

²Population numbers are found in Section I.

The Burlington HSA has more than twice the population of the Rutland HSA. Given the greater population in the Burlington HSA, more discharges would be expected, even if all other variables (such as health status and the practice style of area physicians) were equal.

In order to remove the effect of the different population size, the rate is used instead of the count. The crude rates for the Burlington and Rutland HSAs provide a different picture from the counts:³

Crude Discharge Rates per 1,000 HSA Residents, 2007
Heart and Circulatory Diseases

Burlington HSA	9.7
Rutland HSA	16.9

Although the Burlington HSA had more Heart and Circulatory discharges, the discharge rate of the Burlington HSA is much lower than that of Rutland's. That is, a resident of the Rutland HSA is more than one and a half times more likely to be hospitalized for heart disease as a resident of the Burlington HSA.

These crude rates are valuable for comparing rates over limited time periods or among similar populations. However, the utility of crude rates is limited because of the link between health status and age. In general, older people use more hospital resources than do younger people.

To make comparisons among health care systems, the effect of different age distributions needs to be removed from these comparisons. In the example above, if the average age in Burlington was 30 and the average age in Rutland was 55, the difference in rates would not be surprising. However, if the average ages in the two service areas were

the same, other explanations would be considered, such as differences in health status, risk factors and/or provision of care.

The issue can be examined by computing age-adjusted rates. Different standards, such as the projected year 2000 U.S. population, can be used for age-adjusting and different age groups can be used in the age adjustment procedure. This volume uses the overall Vermont age distribution when adjusting HSA rates. See Appendix A for a more complete description of the age-adjustment process used in this report.

To illustrate the rationale for age adjusting, consider the 2007 population distribution of the Burlington and Rutland HSAs and the state as a whole shown below. The Burlington HSA has a younger age profile than the Rutland HSA, with a larger proportion of its population

in the 15-44 age category, and a smaller proportion aged 45 and above. Age adjusting eliminates the effect of these differing age distributions on the discharge rates.

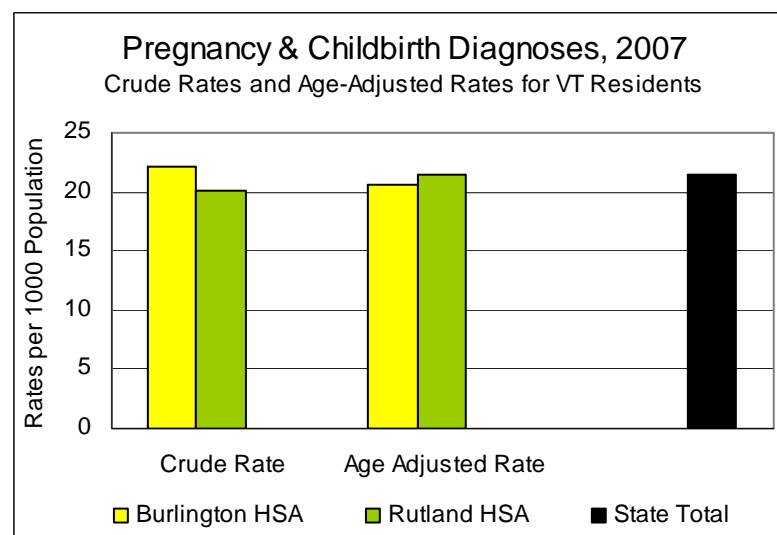

³Crude rates by HSA and MDC are found in Sections V & VI.

When the age-adjusted heart and circulatory discharge rates of the two HSAs are compared, the differences seen in the crude rates become smaller. Burlington HSA's low rate of heart and circulatory discharges was due, in part, to its younger population. Rutland HSA's higher rate was due, in part, to its older population.⁴ Remaining differences may be attributable to differences in underlying health status, risk factors and/or practice patterns.

While heart and circulatory disorders are most common among older populations, delivery and abortion occur almost entirely among women aged 15-44. For this diagnostic category, therefore, the Burlington HSA would be expected to have a higher crude rate than the Rutland HSA due to its younger population. The chart below shows that this is the case. When we take the age structure of the population into account by age-adjusting, we find that in fact the Burlington HSA rate is lower than the Rutland rate.

⁴Age-adjusted rates are found in Section 5.

Hospital-Based Analyses

Some questions require a comparison of hospitals rather than HSAs. Hospital-based analysis is useful for understanding overall hospital utilization. Hospital-based analyses include all people served by the hospital, whether they are Vermont residents or not. Sections II, III, IV, VII, VIII and IX provide various statistics by hospital.

Section II, for example, gives a comprehensive summary of utilization by hospital. The first page of the Section provides a one-page snapshot of all Vermont hospitals plus Dartmouth Hitchcock Medical Center, including total discharges, total patient days, and average length of stay. The remaining pages of Section II present additional detail by hospital for these measures by Major Diagnostic Category (MDC).

The example below uses data from Section II to compare hospitalizations for Heart and Circulatory diagnoses (MDC 5) at Fletcher Allen Health Care and at Rutland Regional Medical Center.

*Number of Patient Days, 2007
Heart and Circulatory Diseases*

Fletcher Allen Health Care	18,499
Rutland Regional Medical Center	2,810

For heart and circulatory diagnoses, Fletcher Allen Health Care provided more than six times as many days of hospitalization as Rutland Regional Medical Center. This difference can be a result of seeing more patients, keeping patients in the hospital longer, or a combination of the two.

In order to determine the contribution of these two factors, the number of Heart and Circulatory patient days can be divided by the number of Heart and Circulatory discharges to produce the average length of stay for Heart and Circulatory hospitalizations.

*Average Length of Stay (Days), 2007
Heart and Circulatory Diseases*

Fletcher Allen Health Care	4.8
Rutland Regional Medical Center	3.6

At Fletcher Allen Health Care, heart and circulatory patients stay an average of 4.8 days, slightly longer than patients at Rutland Regional Medical Center who stay an average of 3.6 days. If the difference were larger, one could reasonably ask whether the patients at Fletcher Allen Health Care are sicker or if the care is less efficient. Researchers have used a variety of tools, such as measures of severity of illness, to answer such questions. This volume does not attempt to answer questions about hospital performance or health of populations. Its purpose is to provide the data that illuminate patterns and evoke questions for further study.

Hospital-Based Analysis Compared with Hospital Service Area Analysis

Various Sections report both hospital-based and HSA data. Section II provides, in addition to the hospital utilization data described above, comparisons of data for hospitals and their HSAs. For example, average length of stay for each hospital is listed next to the average length of stay statistic for its HSA.

Discharge and patient day rates per 1,000 population are provided for each hospital's HSA along with the percent of those discharges and patient days provided by that hospital. In 2007, Fletcher Allen Health Care provided the highest percentage of care to residents of its HSA, accounting for 93.3 percent of the discharges for residents in its HSA and 93.2 percent of the patient days. Rutland Regional Medical Center was second highest, as the provider of 76.4 percent of the discharges and 75.2 percent of the patient days for people who live in its service area.

Data on the extent to which hospitals provide care primarily to residents of their service area are also provided in Section II. Among HSAs with a single hospital, the 2007 data show that North Country Hospital was highest on this measure, with 94.1 percent of their discharges being people who reside in their HSA. Fletcher Allen Health Care had the lowest percent on this measure, with only 53.3 percent of their discharges being people residing in their local service area. Thus, 46.7 percent of Fletcher Allen's discharges were people from other parts of Vermont or out of state.

Section VIII presents data that is hospital service area based, but with additional detail as to which hospital residents from a given HSA were receiving care.

For example in the Barre HSA, 76% of hospitalizations for Respiratory Disease were from the Central Vermont Medical Center. However, for Heart & Circulatory Disease 36% of the discharges were from Central Vermont Medical Center, 30% were from Fletcher Allen Health Care & 27% were from Dartmouth Hitchcock Medical Center.

Population

Population estimates for 2003-2007 used in the inpatient report were created by VDH using adjustments to the National Center for Health Statistics population estimates.

Population data are presented in Section I by HSA. These population statistics are used as the basis for all rates presented in the remaining report.

AREA DAY RATE is the number of days of hospitalization per 1000 population accumulated by the population of the HSA.

AREA DISCHARGE RATE is the number of discharges per 1000 population accumulated in the HSA.

HOSP. SHARE DAYS is the percentage of days accumulated by the HSA population that were at this hospital.

HOSP. SHARE DISCH is the percentage of discharges of residents of the HSA that were from this hospital.

HOSP. TOTAL DAYS is the total number of patient days recorded at this hospital regardless of patient origin.

HOSP. TOTAL DISCH is the total number of discharges from this hospital regardless of patient origin.

PERCENT FROM HSA is the portion of all discharges from this hospital who were residents of this HSA.

AVERAGE LENGTH OF STAY - AREA is the average number of days per discharge for all residents of this HSA, regardless of hospital.

Use of HSA definitions based on 1997-2001 inpatient immediate care discharges began with the 2002 Monograph. Numbers reported here are not directly comparable to those published in earlier reports. See the User's Guide to Inpatient Tables for details.

All rates in this monograph are crude rates. See Section 5 for age-adjusted rates.

AREA DAY RATE is the number of days of hospitalization per 1000 population accumulated by the population of the HSA.

AREA DISCHARGE RATE is the number of discharges per 1000 population accumulated in the HSA.

HOSP. SHARE DAYS is the percentage of days accumulated by the HSA population that were at this hospital.

HOSP. SHARE DISCH is the percentage of discharges of residents of the HSA that were from this hospital.

HOSP. TOTAL DAYS is the total number of patient days recorded at this hospital regardless of patient origin.

HOSP. TOTAL DISCH is the total number of discharges from this hospital regardless of patient origin.

PERCENT FROM HSA is the portion of all discharges from this hospital who were residents of this HSA.

PERCENT WITH DIAG. is the portion of all discharges from this hospital in the indicated diagnostic category.

AVERAGE LENGTH OF STAY - AREA is the average number of days per discharge for all residents of this HSA, regardless of hospital.

AVERAGE LENGTH OF STAY - HOSP is the average number of days per discharge for all users of this hospital, regardless of origin.

*Sex-specific population used in rate calculation.

Use of HSA definitions based on 1997-2001 inpatient immediate care discharges began with the 2002 Monograph. Numbers reported here are not directly comparable to those published in earlier reports. See the User's Guide to Inpatient Tables for details.

All data exclude newborns. Data may not add to totals due to rounding or missing values.

All rates in this monograph are crude rates. See Section 5 for age-adjusted rates.

AREA DAY RATE is the number of days of hospitalization per 1000 population accumulated by the population of the HSA.

AREA DISCHARGE RATE is the number of discharges per 1000 population accumulated in the HSA.

HOSP. SHARE DAYS is the percentage of days accumulated by the HSA population that were at this hospital.

HOSP. SHARE DISCH is the percentage of discharges of residents of the HSA that were from this hospital.

HOSP. TOTAL DAYS is the total number of patient days recorded at this hospital regardless of patient origin.

HOSP. TOTAL DISCH is the total number of discharges from this hospital regardless of patient origin.

PERCENT FROM HSA is the portion of all discharges from this hospital who were residents of this HSA.

PERCENT WITH DIAG. is the portion of all discharges from this hospital in the indicated diagnostic category.

AVERAGE LENGTH OF STAY - AREA is the average number of days per discharge for all residents of this HSA, regardless of hospital.

AVERAGE LENGTH OF STAY - HOSP is the average number of days per discharge for all users of this hospital, regardless of origin.

*Sex-specific population used in rate calculation.

Use of HSA definitions based on 1997-2001 inpatient immediate care discharges began with the 2002 Monograph. Numbers reported here are not directly comparable to those published in earlier reports. See the User's Guide to Inpatient Tables for details.

HOSP. SHARE DAYS is the percentage of days accumulated by the HSA population that were at this hospital.

HOSP. SHARE DISCH is the percentage of discharges of residents of the HSA that were from this hospital.

HOSP. TOTAL DAYS is the total number of patient days recorded at this hospital regardless of patient origin.

HOSP. TOTAL DISCH is the total number of discharges from this hospital regardless of patient origin.

PERCENT FROM HSA is the portion of all discharges from this hospital who were residents of this HSA.

PERCENT WITH DIAG. is the portion of all discharges from this hospital in the indicated diagnostic category.

AVERAGE LENGTH OF STAY - AREA is the average number of days per discharge for all residents of this HSA, regardless of hospital.

AVERAGE LENGTH OF STAY - HOSP is the average number of days per discharge for all users of this hospital, regardless of origin.

*Sex-specific population used in rate calculation.

Use of HSA definitions based on 1997-2001 inpatient immediate care discharges began with the 2002 Monograph. Numbers reported here are not directly comparable to those published in earlier reports. See the User's Guide to Inpatient Tables for details.

Use of HSA definitions based on 1997-2001 inpatient immediate care discharges began with the 2002 Monograph. Numbers reported here are not directly comparable to those published before 2002. See the User's Guide to Inpatient Tables for details.

The Veteran's Administration in White River Junction stopped submitting records after June 30, 2006. 2006 and 2007 discharges and rates may be underestimated for the White River Jct. HSA and to a lesser degree Springfield and Randolph HSAs. Discharges for Major Diagnostic Categories Male Reproductive and Substance Abuse may be underestimated as well.

Use of HSA definitions based on 1997-2001 inpatient immediate care discharges began with the 2002 Monograph. Numbers reported here are not directly comparable to those published before 2002. See the User's Guide to Inpatient Tables for details.

The Veteran's Administration in White River Junction stopped submitting records after June 30, 2006. 2006 and 2007 discharges and rates may be underestimated for the White River Jct. HSA and to a lesser degree Springfield and Randolph HSAs. Discharges for Major Diagnostic Categories Male Reproductive and Substance Abuse may be underestimated as well.

Use of HSA definitions based on 1997-2001 inpatient immediate care discharges began with the 2002 Monograph. Numbers reported here are not directly comparable to those published before 2002. See the User's Guide to Inpatient Tables for details.

The Veteran's Administration in White River Junction stopped submitting records after June 30, 2006. 2006 and 2007 discharges and rates may be underestimated for the White River Jct. HSA and to a lesser degree Springfield and Randolph HSAs. Discharges for Major Diagnostic Categories Male Reproductive and Substance Abuse may be underestimated as well.

Use of HSA definitions based on 1997-2001 inpatient immediate care discharges began with the 2002 Monograph. Numbers reported here are not directly comparable to those published before 2002. See the User's Guide to Inpatient Tables for details.
 The Veteran's Administration in White River Junction stopped submitting records after June 30, 2006. 2006 and 2007 discharges and rates may be underestimated for the White River Jct. HSA and to a lesser degree Springfield and Randolph HSAs. Discharges for Major Diagnostic Categories Male Reproductive and Substance Abuse may be underestimated as well.

This table includes Vermont residents only.

Use of HSA definitions based on 1997-2001 immediate care inpatient discharges began in 2002. Numbers reported here are not directly comparable to those published before 2002. See the User's Guide to Inpatient Tables for details.

%Cases is the percent of all cases from this hospital service area which were discharged from this hospital. %SURG is the percent of cases from this HSA and hospital which had a surgical procedure. Total of individual MDCs may not equal ALL DIAGNOSES due to missing MDC values.

The Veterans Administration stopped providing data June 30, 2006.

This table includes Vermont residents only.

Use of HSA definitions based on 1997-2001 immediate care inpatient discharges began in 2002. Numbers reported here are not directly comparable to those published before 2002. See the User's Guide to Inpatient Tables for details.

%Cases is the percent of all cases from this hospital service area which were discharged from this hospital. %SURG is the percent of cases from this HSA and hospital which had a surgical procedure. Total of individual MDCs may not equal ALL DIAGNOSES due to missing MDC values.

This table includes Vermont residents only.

Use of HSA definitions based on 1997-2001 immediate care inpatient discharges began in 2002. Numbers reported here are not directly comparable to those published before 2002. See the User's Guide to Inpatient Tables for details.

%Cases is the percent of all cases from this hospital service area which were discharged from this hospital. %SURG is the percent of cases from this HSA and hospital which had a surgical procedure. Total of individual MDCs may not equal ALL DIAGNOSES due to missing MDC values.

The Veterans Administration stopped providing data June 30, 2006.

This table includes Vermont residents only.

Use of HSA definitions based on 1997-2001 immediate care inpatient discharges began in 2002. Numbers reported here are not directly comparable to those published before 2002. See the User's Guide to Inpatient Tables for details.

%Cases is the percent of all cases from this hospital service area which were discharged from this hospital. %SURG is the percent of cases from this HSA and hospital which had a surgical procedure. Total of individual MDCs may not equal ALL DIAGNOSES due to missing MDC values.

The Veterans Administration stopped providing data June 30, 2006.

This table includes Vermont residents only.

Use of HSA definitions based on 1997-2001 immediate care inpatient discharges began in 2002. Numbers reported here are not directly comparable to those published before 2002. See the User's Guide to Inpatient Tables for details.

%Cases is the percent of all cases from this hospital service area which were discharged from this hospital. %SURG is the percent of cases from this HSA and hospital which had a surgical procedure. Total of individual MDCs may not equal ALL DIAGNOSES due to missing MDC values.

The Veterans Administration stopped providing data June 30, 2006.

This table includes Vermont residents only.

Use of HSA definitions based on 1997-2001 immediate care inpatient discharges began in 2002. Numbers reported here are not directly comparable to those published before 2002. See the User's Guide to Inpatient Tables for details.

%Cases is the percent of all cases from this hospital service area which were discharged from this hospital. %SURG is the percent of cases from this HSA and hospital which had a surgical procedure. Total of individual MDCs may not equal ALL DIAGNOSES due to missing MDC values.

The Veterans Administration stopped providing data June 30, 2006.

This table includes Vermont residents only.

Use of HSA definitions based on 1997-2001 immediate care inpatient discharges began in 2002. Numbers reported here are not directly comparable to those published before 2002. See the User's Guide to Inpatient Tables for details.

%Cases is the percent of all cases from this hospital service area which were discharged from this hospital. %SURG is the percent of cases from this HSA and hospital which had a surgical procedure. Total of individual MDCs may not equal ALL DIAGNOSES due to missing MDC values.

The Veterans Administration stopped providing data June 30, 2006.

This table includes Vermont residents only.

Use of HSA definitions based on 1997-2001 immediate care inpatient discharges began in 2002. Numbers reported here are not directly comparable to those published before 2002. See the User's Guide to Inpatient Tables for details.

%Cases is the percent of all cases from this hospital service area which were discharged from this hospital. %SURG is the percent of cases from this HSA and hospital which had a surgical procedure. Total of individual MDCs may not equal ALL DIAGNOSES due to missing MDC values.

The Veterans Administration stopped providing data June 30, 2006.

Use of HSA definitions based on 1997-2001 immediate care inpatient discharges began in 2002. Numbers reported here are not directly comparable to those published before 2002. See the User's Guide to Inpatient Tables for details.

%Cases is the percent of all cases from this hospital service area which were discharged from this hospital. %SURG is the percent of cases from this HSA and hospital which had a surgical procedure. Total of individual MDCs may not equal ALL DIAGNOSES due to missing MDC values.

The Veterans Administration stopped providing data June 30, 2006.

This table includes Vermont residents only.

Use of HSA definitions based on 1997-2001 immediate care inpatient discharges began in 2002. Numbers reported here are not directly comparable to those published before 2002. See the User's Guide to Inpatient Tables for details.

%Cases is the percent of all cases from this hospital service area which were discharged from this hospital. %SURG is the percent of cases from this HSA and hospital which had a surgical procedure. Total of individual MDCs may not equal ALL DIAGNOSES due to missing MDC values.

The Veterans Administration stopped providing data June 30, 2006.

APPENDIX A

Definitions and Formulae

Average Length of Stay (ALOS): The arithmetic mean days of stay in hospital for the selected group of discharges:

$$\text{Avg. Length of Stay} = \frac{\text{Total Number of Patient Days in the Selected Group}}{\text{Total Number of Discharges in the Selected Group}}$$

Charges: Charges in this report are defined as hospital "facility" charges that are calculated by subtracting professional fees and patient convenience items charges from the total charge. However, facility charge data are not always reported according to the strict definition and some hospitals may have included salaried and contracted physician fees in their facility charges. Inpatient charges less than \$100 are set to missing.

Clinical Classifications Software (CCS) Grouper: CCS was developed at the Agency for Healthcare Research and Quality (AHRQ) and is available at the website: <http://www.ahrq.gov/data/hcup/ccs.htm>. CCS collapses principal diagnosis and procedure codes into meaningful categories. The single-level diagnosis CCS aggregates illnesses and conditions into more than 260 categories. Similarly, the single-level procedure CCS aggregates procedures into 231 categories, most representing single types of procedures. High level CCS groups further collapse single-level CCS into broad groups based on body systems or condition categories.

Diagnosis: The condition, determined after study, which occasioned the patient's admission to the hospital. The accuracy or reliability of the diagnosis depends on several factors including the physician's understanding of the problem and the recorder's ability to fit this to established coding conventions. For those cases with multiple problems, the primary diagnosis may not be the reason for surgery or cause of death.

Diagnosis Related Group (DRG), MS-DRG: A classification system that groups patient discharges into more than 500 (DRG) or more than 900 (MS-DRG) categories according to diagnosis, type of treatment, age, and other relevant criteria. Under the prospective payment system, hospitals are paid a set fee for treating Medicare beneficiaries in a single DRG category, regardless of the actual cost of care for the individual. See Appendix C for a complete listing of DRGs.

Discharge: The equivalent of a hospital admission, except that for a specified time period, only those cases discharged are counted. Note that discharges do not necessarily reflect disease incidence or prevalence, just the fact of utilization of the hospital resource. Maternal records are included, but newborn records are excluded from the inpatient dataset, to avoid duplicate counts. However, newborn records are retained in the Vermont Uniform Hospital Discharge Dataset.

Emergency Department (ED) Dataset: Consists of all records that had an associated revenue code beginning 45 (Emergency Room).

Hospital Service Area (HSA): A group of Vermont ZipTowns (see definition of ZipTown below) based on each ZipTown's use of hospital resources. Starting in 2002, HSAs are based on inpatient discharges, where the diagnosis indicated the need for immediate care, for the years 1997-2001. In this fourth version of HSAs, ZipTowns were assigned to HSAs based on a plurality rule. Prior definitions of HSAs have been based on all inpatient stays (except for newborns) and have used a strict decision rule for inclusion of Zip Towns in a hospital's service area. Use of a strict inclusion rule meant that there were always towns that were not assigned to any HSA and were labeled "contested." In this fourth version of HSAs, no towns are considered contested. See the Introduction for a map of HSAs and the User's Guide to Inpatient Tables for an in-depth discussion of ZipTowns and HSAs.

Two HSAs contain more than one hospital: White River Junction (Dartmouth Hitchcock Medical Center, Mt. Ascutney Hospital, and the Veterans Administration Hospital) and Brattleboro (Brattleboro Memorial Hospital and Grace Cottage Hospital).

Inpatient Dataset: Consists of discharge records that were billed as an inpatient stay. Maternal records are included, but newborns are excluded, to avoid duplicate counts. However, newborn records are retained in the Vermont Uniform Hospital Discharge Dataset.

Major Diagnostic Category (MDC): The aggregation of DRGs into 25 groups that define major body systems. See Appendices B and C for a list of MDCs and related DRGs.

Market Share: An individual hospital's share of the total hospital utilization of a given area, expressed as a percentage.

Outpatient Procedures Dataset: Consists of outpatient records with a procedure in the ICD-9-CM code range of 00.0-86.00 that were performed in an operating room, ambulatory surgery area, or other outpatient setting.

Patient Day: A stay in hospital for all or part of a day.

Population-based Rate: The rate of a population's use of hospital inpatient services. Rates in this report represent hospital discharges or days per 1,000 population for the selected group.

The *crude rate* is calculated as follows:

$\text{Crude Rate per 1,000 People} = \frac{\text{Number of Discharges or Patient Days For the Selected Group}}{\text{Total Population for the Selected Group}} \times 1,000$

These rates depend upon the accuracy of both the numerator and the denominator population. Data on population-at-risk (the denominator in these rates) are based on estimates. Rates for small areas or for groups with small numerators should be used with caution.

Age adjusted rates are particularly important for comparisons across areas because service areas have different population age mixes and age is a strong factor influencing hospitalization patterns. The age-adjusted rate for a given hospital service area is calculated by multiplying the area's age specific rate for each age group by the state population in that age group, summing across age groups, and dividing the result by the total state population. This result is then multiplied by 1,000. The following age groups are used in this volume for the computation of age-adjusted rates: 0-4, 5-14, 15-24, 25-34, 35-44, 45-54, 55-64, 65-69, 70-74, 75-79, and 80+. In other publications such as the Monograph Companion, or when comparing to national rates, different standards, such as the projected year 2000 U.S. population, are used for age adjusting and different age groupings may also be used in the age adjusting process.

Principal Payer: The anticipated principal source of payment of the patient's hospital bill recorded by the hospital on each discharge record.

ZipTown Grouping: The combination of towns into groups with compatible town and Zip code boundaries to reconcile discrepancies between mailing address and town of residence. Towns are also grouped to achieve a minimum population of 1000 persons in each Zip Town group. ZipTowns were updated in 1996, with minor adjustments in 2004. This volume reflects these changes.
